**Formula:**

$$\text{Percent} = \frac{\text{Inches per foot} \times 100}{12}$$

**Inches in decimals of a foot**

1/16 = .0052	1 = .0833
3/32 = .0078	2 = .1667
1/8 = .0104	3 = .2500
3/16 = .0156	4 = .3333
1/4 = .0208	5 = .4167
5/16 = .0260	6 = .5000
3/8 = .0313	7 = .5833
1/2 = .0417	8 = .6667
5/8 = .0521	9 = .7500
3/4 = .0625	10 = .8333
7/8 = .0729	11 = .9167

### **Vibratory and Pneumatic Tire Compactors**

#### **Sustainability:**

- Long-lasting lubricants and fluids extend maintenance intervals, decreasing the amount of waste and filters contributed to environment.
- Ecology drains provide a simple means to drain machine fluids with a minimized risk of spillage.
- Maintenance free Cat batteries are recyclable.
- Cat ACERT engines meet applicable emission standards.
- Biodegradable oil option available.

#### **General Compactor Features:**

- **Routine maintenance** simplified by grouped service points and easy access to service areas.
- **Operator stations** designed for maximum comfort, easy control, and optimal visibility.
- **Direct hydrostatic drive to front (drums or wheels) and rear (drums or wheels)** provides dependable, responsive, propulsion effort and maximum gradeability. (Does not include pneumatic tire compactors.)
- **Eco-mode standard equipment** on B Series Vibratory Soil Compactors and Double Drum Rollers reduces fuel consumption.

#### **Vibratory Compactor Features:**

##### **Single Drum**

- **Dual pump system** delivers positive tractive effort to both drum and rear wheels, regardless of underfooting. This increases the machine's ability to maneuver in a wide variety of soil types and conditions and improves gross gradeability.
- **Limited slip high traction differential** is standard on all units for best traction of rear tires.
- **Optional heavy-duty front-mounted blade** with reversible cutting edge is available to allow backfilling and leveling during compaction.
- **ROPS (Roll Over Protective Structure)** standard on all units. Enclosed cabs with EROPS rating available as an option.

- **Optional Cat Compaction Control** featuring exclusive Machine Drive Power (MDP) or CMV (accelerometer-based) measurement scalable to include GNSS mapping and recording.
- **Adjustable jaw-type cleaner bar** keeps drums clean between pads during forward and reverse movement.

##### **Double Drum and Combi**

- **Vibration automatically ceases before machine comes to a stop** to help produce a smooth, flawless mat surface.
- **Close side clearances** allow compactors to work close to curbs, walls and other obstructions.
- **Large, rust-proof water tanks and pressure spray system** provide hours of reliable operation between fill-ups.
- **Emulsion system** available for combi compactor rear tires to prevent materials sticking to tires.
- **ROPS (Roll Over Protective Structure)** available on all models. Enclosed cabs with EROPS rating available on some models.
- **Optional Cat Compaction Control** featuring GNSS mapping of pass count and mat surface temperature.

##### **Pneumatic Tire Compactor Features:**

- **All wheel oscillation.** Front and rear tires provide even wheel loads regardless of evenness underfoot.
- **High drive propel system.** Completely hydrostatic with drive motors and brakes located in mainframe away from contamination and damage.
- **Ballast compartments** are easily accessible for quick loading and are located to provide balanced wheel/weight ratio.
- **Single-lever hand control** of forward and reverse movement makes smooth rolling easy.
- **Optional Cat Compaction Control** featuring GNSS mapping of pass count and mat surface temperature.

**NOTE: All models and options are not available in all markets.**

#### NOTES:

1. Each tire type has a unique pressure distribution which varies with both tire inflation pressure and wheel load. The distribution of pressure along both transverse and longitudinal profiles is rarely uniform.
2. The measurements in this table represent the peak pressures measured in a transverse profile at each of the ballast conditions at maximum tire inflation pressure.
3. For most applications, it can be assumed that normal operation of the pneumatic compactor will result in the ground being subjected to pressures near the maximum during at least one machine pass.

**Ground Contact Pressures — CW34**

Average Wheel Load	Tire Pressure

**NOTES:**

1. Each tire type has a unique pressure distribution which varies with both tire inflation pressure and wheel load. The distribution of pressure along both transverse and longitudinal profiles is rarely uniform.
2. The measurements in this table represent the peak pressures measured in a transverse profile at each of the ballast conditions at maximum tire inflation pressure.
3. For most applications, it can be assumed that normal operation of the pneumatic compactor will result in the ground being subjected to pressures near the maximum during at least one machine pass.

The tables in this section give production estimates for the following assumed conditions:

Nominal machine travel speed: 6.4 km/h (4.0 mph)

Overlap of rolling width: 15.2 cm (6.0 inches)

Table values give **representative** production rates for three common construction conditions: trenches, roads, and wide areas (> 15 m, or 50 ft).

Model	Drum Width		Lift Thickness		Passes Required	Production Estimates			
	cm	in	cm	in		3.7 m (12 ft) Trench	9.15 m (30 ft) Road Base	Wide Areas	
CS423E, CS44, CS44B	167.6	66	10.2	4	4	m <sup>3</sup> /hr yds <sup>3</sup> /hr	159 209	249 326	249 326

Travel Speed Efficiency

**Adjusting the Production Estimate**

If the assumed conditions are not close to the actual construction conditions, the production estimates should be corrected. The production estimate from the table can be adjusted for ‘actual’ construction conditions by applying adjustment factors:

$$Q \text{ (actual)} = Q \text{ (assumed)} \times F_s \times F_t \times F_p$$

- Where: Q (actual) = adjusted productivity
- Q (assumed) = productivity from table based on assumed conditions
- F<sub>s</sub> = adjustment for machine speed
- F<sub>t</sub> = adjustment for layer thickness
- F<sub>p</sub> = adjustment for no. of passes

The adjustment factors are determined by comparing the ‘actual’ conditions to the ‘assumed’ ones:

- F<sub>s</sub> = actual speed/assumed speed
- F<sub>t</sub> = actual thickness/assumed thickness
- F<sub>p</sub> = assumed passes/actual passes

Metric example

*Actual Conditions* — An 9.15-meter (full road width) base aggregate job is being completed with a compacted thickness of 15 cm. A CS44B is being used, operating at 4.0 km/h, and making 6 passes to achieve the desired compaction. The roller is overlapping its passes 6 inches.

For a 9.15-meter road base the table gives a CS44B productivity of 249 m<sup>3</sup>/hr. Since the speed, thickness, and passes are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
<b>Speed</b>	6.4 km/h	4.0 km/h
<b>Thickness</b>	10.2 cm	15 cm
<b>Passes</b>	4 passes	6 passes

$$F_s = 4.0 \text{ km/h}/6.4 \text{ km/h} = 0.6$$

$$F_t = 15 \text{ cm}/10.2 \text{ cm} = 1.5$$

$$F_p = 4 \text{ passes}/6 \text{ passes} = 0.7$$

The estimated production is adjusted using these factors:

$$Q \text{ (actual)} = 249 \text{ m}^3/\text{hr} \times 0.6 \times 1.7 \times 0.7$$

$$= 178 \text{ m}^3/\text{hr} \text{ (233 yds}^3/\text{hr)}$$

English example

*Actual Conditions* — An wide area commercial site development job is being compacted in lifts of 8 inches. A CP56B is being used, operating at 4.0 mph, and making 4 passes to achieve the target density.

First, the table gives a CP56B productivity of 847 yds<sup>3</sup>/hr. Since lift thickness and passes required are *different* from the assumed conditions, we should adjust this estimate:

	Assumed	Actual
<b>Speed</b>	4.0 mph	4.0 mph
<b>Thickness</b>	12 inches	8 inches
<b>Passes</b>	6 passes	4 passes

$$F_s = \text{no correction necessary}$$

$$F_t = 8 \text{ inches}/12 \text{ inches} = 0.7$$

$$F_p = 6 \text{ passes}/4 \text{ passes} = 1.5$$

The estimated production is adjusted using these factors:

$$Q \text{ (actual)} = 847 \text{ yds}^3/\text{hr} \times 0.7 \times 1.5$$

$$= 890 \text{ yds}^3/\text{hr} \text{ (680 m}^3/\text{hr)}$$

**Notes on Productivity:**

- For jobs that are relatively narrow, especially road construction jobs, it is important to understand that certain widths of construction will be more productive than others for a given compactor. A productive construction width will make the most use of each side by side pass required by the compactor in order to cover the width.
- Production estimates should be adjusted further if the length of the compaction cycles are shorter than 75 m (250 ft). Refer to the Travel Speed Efficiency chart to determine efficiency E<sub>TS</sub>. For example, a compactor traveling at 6.4 km/h (4 mph) operating at cycle lengths of 150 ft has an E<sub>TS</sub> of 0.91. Multiply Q (actual) by E<sub>TS</sub>.

The table in this section gives production estimates for the following assumed conditions:

Compacted Layer Thickness	51 mm	2 in
Maximum Vibratory Frequency*	—	—
Impacts Spacing	33 impacts/m	10 impacts/ft
Passes per Machine Width	2	2
Compacted Material Density	2483 kg/m <sup>3</sup>	155 lb/ft <sup>3</sup>
Overlap of Rolling Width	152 mm	6 in
Overhang at Lane Edge	76 mm	3 in
Efficiency	75%	

\*Maximum vibratory frequency varies by machine, refer to table.

Table values give **representative** production rates for common construction widths. If the actual width falls between two assumed widths, use the higher number to estimate production. Minor adjustments can normally be made in the rolling method to reach this higher production: reduce overlap or overhang, increase speed, or increase the cycle time.

Model	Vibration Frequency	Units	PAVING WIDTH						
			1.8 m 6 ft	2.4 m 8 ft	3.0 m 10 ft	3.7 m 12 ft	4.3 m 14 ft	4.9 m 16 ft	5.5 m 18 ft

### Example

*Actual Conditions* — A 3.7 m (12 ft) lane is being paved with a compacted asphalt thickness of 10 cm (4 in). A CB54B is operating with a frequency of 42 Hz (2520 vpm) and 46 impacts per meter (14 impacts per ft) and making 4 passes to achieve target density. The roller is overlapping its passes 15 cm (6 in) and is overhanging the edges by 7.5 cm (3 in).

First, the table gives a CB54B productivity of 343 Tonnes/hr (378.6 tons/hr) for a 3.7 m (12 ft) paving width. Since the actual vibratory speed, thickness, impact spacing and passes are different from the assumed conditions, the estimate should be adjusted.

	Assumed	Actual
<b>Vibratory Speed</b>	63.3 Hz <b>3800 vpm</b>	42 Hz <b>2520 vpm</b>
<b>Impact Spacing</b>	33 impacts/m <b>10 impacts/ft</b>	46 impacts/m <b>14 impacts/ft</b>
<b>Thickness</b>	5 cm <b>2 in</b>	10 cm <b>4 in</b>
<b>Passes</b>	<b>2</b>	<b>4</b>

$$F_s = 42 \text{ Hz (2520 vpm)} / 63.3 \text{ Hz (3800 vpm)} = 0.66$$

$$F_i = 33 \text{ impacts/m (10 impacts/ft)} / 46 \text{ impacts/m (14 impacts/ft)} = 0.71$$

$$F_t = 10 \text{ cm (4 in)} / 5 \text{ cm (2 in)} = 2.0$$

$$F_p = 2 \text{ passes} / 4 \text{ passes} = 0.5$$

The actual, or adjusted, production estimate can then be determined from the following:

$$Q \text{ (actual)} = 343 \text{ Tonnes/hr (378.6 tons/hr)} \\ \times 0.66 \times 0.71 \times 2 \times 0.5 = \\ 161 \text{ Tonnes/hr (177.4 tons/hr)}$$

### Notes on Productivity:

- Higher speed usually results in lower density achieved per pass.
- Productivity on uphill slopes may be reduced.
- Tabulated production estimates assume that 1 pass is used for re-positioning the machine at the beginning of the next run.

The tables in this section give production estimates for the following assumed conditions:

	Hot Mix Asphalt		Soil and Aggregate		Cold In-Place Recycled Asphalt	
Compacted Layer Thickness	51 mm	<b>2 in</b>	152 mm	<b>6 in</b>	203 mm	<b>8 in</b>
Maximum Propelling Speed	8 km/h	<b>5 mph</b>	8 km/h	<b>5 mph</b>	4.8 km/h	<b>3 mph</b>
Passes per Machine Width	<b>4</b>		<b>4</b>		<b>6</b>	
Compacted Material Density	2486 kg/cm <sup>3</sup>	<b>155 lb/ft<sup>3</sup></b>	2085 kg/cm <sup>3</sup>	<b>130 lb/ft<sup>3</sup></b>	2246 kg/cm <sup>3</sup>	<b>140 lb/ft<sup>3</sup></b>
Overlap of Rolling Width	152 mm	<b>6 in</b>	152 mm	<b>6 in</b>	152 mm	<b>6 in</b>
Overhang at Lane Edge	76 mm	<b>3 in</b>	76 mm	<b>3 in</b>	76 mm	<b>3 in</b>
Cycle Time (2 passes)	<b>120 seconds</b>		<b>120 seconds</b>		<b>120 seconds</b>	

Table values give **representative** production rates for common construction widths. If the actual width falls between two assumed widths, use the higher number to estimate production. Minor adjustments can normally be made in the rolling method to reach this higher production: reduce overlap or overhang, increase speed, or increase the cycle time.

Example

*Actual Conditions* — A 7.3 m (23'11") (full road width) base aggregate job is being completed with a compacted thickness of 200 mm (8 in). A CW14 is being used, operating at 6.5 km/h (4 mph), and making 6 passes achieve the desired compaction. The roller is overlapping its passes 152 mm (6 in).

First, the table does not show production for 7.3 m (23'11") so use the greatest width on the table: 5.5 m (18'1"). The table gives a CW14 productivity of 778.4 Tonnes/hr (858.0 tons/hr) for this paving width. We can expect that the actual productivity for 7.3 m (23'11") will be slightly higher than that. Since the speed, thickness, and passes are *different* from the assumed conditions, we should adjust this estimate:

	Assumed		Actual	
<b>Speed</b>	8 km/h	<b>5 mph</b>	6.5 km/h	<b>4 mph</b>
<b>Thickness</b>	152 mm	<b>6 in</b>	200 mm	<b>8 in</b>
<b>Passes</b>	<b>4</b>		<b>6</b>	

$$F_s = 6.5 \text{ km/h} / 8 \text{ km/h} (4 \text{ mph} / 5 \text{ mph}) = 0.8$$

$$F_t = 200 \text{ mm} / 152 \text{ mm} (8 \text{ in} / 6 \text{ in}) = 1.3$$

$$F_p = 4 \text{ passes} / 6 \text{ passes} = 0.7$$

The estimated production is adjusted using these factors:

$$Q (\text{actual}) = 778.4 \text{ Tonnes/hr} (858.0 \text{ tons/hr}) \times 0.8 \times 1.3 \times 0.7 = 567 \text{ Tonnes/hr} (625 \text{ ton/hr})$$

**Notes on Productivity:**

- Ballast weight and tire pressure can significantly affect performance of a pneumatic tire compactor. Refer to machine specifications to choose the best configuration.
- Productivity on uphill grades and very thick layers (>127 mm, or 5 in) may be reduced due to a necessary reduction in speed.
- The 11-tire configuration for the CW14 is designed only for chip-and-seal applications. It is not recommended in other applications.

## Features:

- **Hydrostatic transmission** on PL61.
- **Planetary power shift** transmission on PL72, PL83 and PL87 models.
- **Kick-out helps prevent boom bending** as boom approaches near-vertical.
- **Sealed and Lubricated Track.**
- **Simplified Controls** for all functions including raise, lower, quick-drop and power down, variable range and speed adjustments.
- **Modular design of major components and accessory drive system** for simplified repair.
- **Separate, self-energizing brakes** for boom and hook winches.
- **Positive** track pin retention (PL83 and PL87).
- **Hydraulic Drawworks** with two independently driven hydraulic motors for boom and hook winches.

**PIPELAYER APPLICATION CALCULATIONS:**

**Typical pipelayer applications on flat, firm underfoot conditions**

- PL61** laying 8" to 16" pipe
- PL72** laying 16" to 24" pipe
- PL83** laying 24" to 36" pipe
- PL87** laying 36" to 56" pipe

The chart above provides general information representing typical pipelayer applications. While the following scenario explores many of the variables involved in pipelaying it does not cover all the possible variables that must be considered by pipelaying contractors.

When sizing pipelayers for an application there are many considerations other than the machine's SAE rated lift capacity. These include but are not limited to:

- pipe diameter and weight per linear foot
- ditch width and depth
  - ditch width is typically  $2 \times$  pipe diameter
  - ditch depth is typically  $>2.5 \times$  pipe diameter
- distance from the ditch (safe slope) required by soil stability conditions
  - varies by local ground conditions but typically 2:1 (meaning the pipelayer must be  $2 \times$  ditch depth from the ditch edge)

- acceptable distance between pipe lifting points while suspended (to prevent bending)
  - determined by the pipe's bending characteristics.
  - If the lifting points are too far apart a pipe can sag enough due to its own weight that it will damage itself.
- the operating safety factor desired by the contractor
- the length of pipe that will need to be suspended while laying-in
  - determined by pipe bending characteristics, terrain, etc.
- ground conditions, road bed preparation

An important consideration is the necessary load overhang. This is the distance from the center of the pipe to the tractor's left track rail. The load overhang required for an application can be estimated by:

- load overhang = safe slope × ditch depth + (0.5 × ditch width)

The pipelayer's rated load capacity at a specific load overhang (per ANSI/ASME B30.14) can be found in the load capacity graphs in this section of the performance handbook. Once the load capacity is determined the maximum lift point spacing can be estimated by:

- max lift point spacing =  $\frac{\text{load capacity at load overhang}}{\text{safety factor} \times \text{pipe weight per linear foot}}$

The maximum distance between pipe lift points (based on pipe bending characteristics) may be a shorter distance than the maximum spacing between lift points as calculated based on pipelayer load capacity. If this is the case, then in order to avoid damaging the pipe, the shorter distance should be considered to be the maximum distance between pipelayers.

As an example, consider a project involving 0.5" wall 24" diameter pipe which has a weight per linear foot of 125.5 lb and the soil has a safe slope of 2. Using the above formulas:

- the ditch depth would be 3 × 2 ft = 6 ft deep
- the ditch width would be 2 × 2 ft = 4 ft
- the load overhang would be 2 × 6 ft + (0.5 × 4 ft) = 14 ft

Using the PL72's lift capacity chart we find that the PL72 has an ANSI rated load capacity of approximately 21,250 lb at a 14 ft load overhang.

When using rated load numbers it is important to understand that the lift capacity charts are based on SAE and ANSI test procedures that rate pipelayers on level, concrete surfaces. Working on softer underfoot conditions, working on slopes, (and other) can greatly reduce the pipelayer's load capacity.

If the contractor employs a safety factor of 2 then the maximum spacing between pipe lift points is:

$$\frac{21,250 \text{ lb}}{2 \times 125.5 \text{ lb/ft}} = 84.7 \text{ ft}$$

It is important to remember that this is the distance between the lift points, not the distance nose-to-tail between pipelayers. For this example, assume that 500 ft of pipe must be suspended during the laying-in process.

$$\frac{500 \text{ ft}}{84.7 \text{ ft per pipelayer}} = 5.9 \text{ which means that six pipelayers are needed}$$

The number of pipelayers required could also be determined by a second method:

$$\frac{\text{ft of pipe suspended} \times \text{pipe weight per ft} \times \text{safety factor}}{\text{rated load at overhang}}$$

In this case:

$$\frac{500 \text{ ft} \times 125.5 \text{ lb/ft} \times 2}{21,250 \text{ lb}} = 5.9 \text{ which again implies six pipelayers}$$

If, in this same example, soil conditions required a safe slope of 2.33 then the load overhang would have been 16 ft. At this load overhang the 90,000 lb lift pipelayer's rated load capacity is approximately 18,125 lb. Using the equations above, this results in 72.2 ft between lift points which means that seven 90,000 lb lift pipelayers are now necessary. Using the second method:

$$\frac{500 \text{ ft} \times 125.5 \text{ lb/ft} \times 2}{18,125 \text{ lb}} = 6.9 \text{ again implying that seven 90,000 lb lift pipelayers are needed}$$

Rather than adding another pipelayer, PL83's could be used. At a 16 ft load overhang the PL83 has a rated load capacity of 29,400 lb. This translates to 117.1 ft between lift points. If the pipe's bending characteristics will allow this space between lift points, the job could be done with only five PL83's.

## EXTREME SLOPE OPERATION

The maximum fore and aft grade in static condition on which each track-type tractor or pipelayer will maintain proper lubrication is 45 degrees (100%). Consult Operation & Maintenance Manual (if applicable) for POWER TRAIN fluid level overfill requirements for operation on extreme slopes. Extreme slope operation is anytime the slope exceeds 25° (47%).

When working sidehills and slopes, consideration should be given to the following important points:

- Speed of travel — At higher speeds, inertia forces tend to make the tractor less stable.
- Roughness of terrain or surface — Ample allowance should be made where the terrain or surface is uneven.
- Mounted equipment — Bulldozers, sidebooms, winches, and other mounted equipment cause the tractor to balance differently.
- Nature of surface — New earthen fills may give way with the weight of the tractor. Rocky surfaces may promote side slipping of tractor.
- Track slippage due to excessive loads — This may cause downhill track to “dig in,” increasing angle of tractor.

The ENGINE should never be overfilled with oil. This may lead to rapid overheating. For extreme slope operation, engine oil should be maintained at the full mark.

**NOTE:** Both ENGINE and POWER TRAIN fluid levels should be checked on level ground before working sidehills and slopes.

- Implements hitched to the drawbar — This may decrease weight on uphill track, e.g., logging arch, two-wheel wagon.
- Height of hitch on tractor — When a high drawbar is used the tractor is less stable than with the standard drawbar.
- Width of shoes — Wide track shoes tend to decrease “digging in”, hence tractor is more stable.
- Operated equipment — Be aware of the stability and other performance features of the equipment operated by the tractor.
- Keep all attachments or pulled loads low to the ground for optimum stability.

**NOTE:** Safe operation on steep slopes may require special machine maintenance as well as excellent operator skill and proper equipment for the specific application. Consult Operation & Maintenance Manual (if applicable) for proper fluid level requirements.

**Features:**

- **The standard demand cooling fan** provides improved fuel efficiency and increased horsepower.
- **Industry leading sealed and pressurized cab option** provides a cleaner and quieter operating environment with excellent Work Tool visibility on D and D2 Series machines.
- **Ergonomically designed cab** provides maximum operator comfort and visibility.
- **Low-effort joystick controls, armrest and retractable seat belt** for easy operation.
- **Available high-back, heated, air ride seat with seat mounted adjustable joystick controls** make the D and D2 Series machines the industry leaders in operator comfort.
- **Deep skid resistant steps** and two tilt cylinders makes egress/ingress easy.
- **Hand and foot throttle** for continuous or variable engine speed.
- **Anti-stall feature (B3 Series) and Electronic Torque Management (D and D2 Series)** provide maximum rimpull and hydraulic power while lugging the engine.
- **High hydraulic horsepower** gets work done quickly.
- **Direct drive hystat pumps** eliminate drive belts.
- **Ground level access** to all daily service and routine maintenance points helps reduce machine downtime for greater productivity.
- **High performance power train** provides maximum performance and production capability on D and D2 Series machines through the Electronic Torque Management system, optional two speed travel and an electronic hand/foot throttle with decel pedal capability.
- **Cat® “Intelligent Leveling” system (ILEV)** provides industry leading technology, integration and optional features on D and D2 Series machines such as dual direction self level, work tool return to dig and work tool positioner.
- **Speed Sensitive Ride Control** option on D and D2 Series machines improves operation on rough terrain, enabling better load retention, increased productivity and greater operator comfort.
- **Maximize machine capability and control with optional Advanced Display** providing on-screen adjustment capability on D and D2 Series machines for implement response, hystat response, and creep control, multi-language functionality with customizable layouts, security system, and rearview camera.
- **High performance cooling systems and extended life coolant**, along with high performance engine and hydraulic oils, extend service intervals for low operating costs.
- **Deutsch electrical connectors** are color coded, numbered and protected with nylon braiding.
- **Electro-deposited** or “E” coat corrosion protection for long paint life.
- **High flow XPS hydraulics** are optional on most D Series models. The XHP hydraulic package option on the 272D2, 297D2 and 299D2 combines the high pressure of XPS with even higher flow for the most demanding hydromechanical work tool applications such as mulching, cold planing, and wheel saw cutting.
- **High flow hydraulics** on the 226B3, 226D, 232D, 236D, 239D, 242D, 249D, 257D, and 259D operate more demanding, rotating work tools such as brooms, cold planers, trenchers, landscape rakes, power rakes, tillers, snow blowers, brush cutters, and stump grinders.

X – Not Compatible.

**Features:**

- **Cat XT™-3 hose and O-ring face seals** are used throughout for superior leak-free performance.
- **Both standard and tree bits are available in a variety of sizes** for a wide range of projects.
- **Standard bit teeth and pilot points** are produced from hardened steel. Optional hardfaced and carbide inserted teeth are also available.
- **Optional bit extension is available** in 305 mm (12") length.
- **Hex-to-round shaft adapter is available** to accommodate existing round auger bit mountings.
- **A14B and A19B** are compatible with both mini hydraulic excavators and skid steer loaders.

**A14B Auger**

- **Direct drive system** features a variable speed, bidirectional, “Gerotor” style hydraulic motor that generates optimal speed and output torque for light to moderate duty work.

**A19B Auger**

- **Single reduction planetary drive system** transfers power from the drive motor to the drive shaft, reducing motor speed and increasing torque.
- **Drive motor shaft** is splined and couples directly to the planetary gearbox.

**A26B Auger**

- **Double reduction planetary drive system** transfers power from the drive motor to the drive shaft, reducing motor speed and increasing torque.
- **Drive motor shaft** is splined and couples directly to the planetary gearbox.

**Market Opportunities**

- **Agriculture** — Augers are an effective work tool around the farm to drill holes for fence posts, pole barn supports and footers for outbuildings.
- **Building/General Construction** — Augers are an essential work tool on many construction sites to drill holes for deck posts and footings, signs and fencing.

- **Landscaping/Landscape Maintenance** — Augers with special tree bits are ideal for preparing holes for tree planting. They are also ideal for school, park, golf course and recreational maintenance departments to drill holes for playground supports, trees and shrubs, fence posts, and signs.
- **Governmental/Municipalities** — Augers with multiple bit sizes are popular work tools to do a wide spectrum of jobs, including digging holes for traffic signs, poles, posts and trees.
- **Rental** — Augers are one of the highest opportunity rental work tool after buckets.
- **Specialty Trades/Utility** — Augers are ideal for electrical, fencing and plumbing contractors when installing lighting, fence posts and gas/water mains.

Augers are typically not a full time work tool, however they are a highly utilized option for specialized applications. They are often used in conjunction with a bucket, set of pallet forks and/or a trencher.

**Auger Bits**

Auger bits are available in standard duty, industrial duty, standard rock drill head and tree bit configurations with standard hardened, reversible teeth and cast/hardened pilot point. Optional hard-faced and carbide inserted teeth and pilot points are available for aggressive boring conditions. Standard bits are available in diameters ranging from 6"–36"; industrial bits and standard duty rock drill head bits are available in 6"–24" diameters and tree bits are available in 24" and 36" diameters. Typical digging depth is 48", however for deeper holes, optional 12", 24", 3' and 6' extensions are available. A special HEX to round adapter is also available for customers who use existing round shaft auger bits.

152	40	98	310	4500	7079	5238

**Features:**

- **High-strength blades** deliver high cutting action and durability, and also mulch overgrowth.
- **Fully balanced blade carriers** prevent unnecessary vibration.
- **High-strength frame with reinforced corner gussets** provide strength in critical areas.
- **Long life motors** deliver years of high-speed blade performance.
- **Machined and heat treated gears** in sealed gearbox provide reliable, durable transfer of torque from motor to blade carrier.
- **Tapered blade carrier** allows cutter to ride up over stumps and rocks.
- **Galvanized coil chains** provide debris guarding in the front and rear areas to restrict flying debris and material.
- **Heavy-duty skids** allow easy movement of the brush-cutter through uneven terrain while maintaining stability of the work tool and machine.
- **Motor protection guard shields** motor and gear box from debris. Removing a set of bolts allows this hinged guard to be moved away for easy access to motor and gear box.
- **Cat XT-3 hose, couplings and O-ring face seals** provide superior, leak-free performance and reliability. All hoses are wrapped with nylon woven cordura sleeving for added operator protection. Hydraulic quick disconnects enable fast tool changes.
- **Quick coupler** with rugged, opposing edge design holds the work tool securely and allows the operator to quickly change from one high performance Cat Work Tool to another.

**Cat Brushcutters** are used for clearing overgrowth from highway medians, utility easements and for initial land clearing for housing, parks and recreational areas.

**Machine Compatibility**

Tip speed range (depends on flow)	4554-5992 m/min	14,940-19,660 ft/min	4176-6032 m/min	13,700-19,790 ft/min

**Features:**

- **Self-leveling design** automatically levels itself when placed on the ground for consistent depth control without operator adjustments and excellent spoil retention.
- **Two wear resistant skid plates** remain parallel to the ground for optimum stability.
- **Hydraulic side-shift** permits close planing to curbs, walls and other obstructions.
- **Independent left/right depth control** allows maximum drum depths to be adjusted independently on each skid. The gauges are easily viewable from the cab. Independent depth control is mechanical on standard flow planers and hydraulic on high flow planers.
- **Max Pro Pressure gauge** provides operator feedback to adjust speed for maximum productivity in changing material loads. Gauge displays planer performance in real-time conditions and is visible from the cab. Standard on XHP models.
- **Float, spring tilt and hydraulic tilt** enables planers to follow the contour of the surface. Float is activated by a knob and is only available on high flow and XHP planers. Spring tilt and hydraulic tilt enable planers to oscillate for angled cuts. Tilt is hydraulically controlled on high flow models and spring controlled on standard flow planers.
- **Direct drive on standard flow** models features a variable speed, unidirectional, gerotor style hydraulic motor.
- **Direct drive on high flow and XHP** models features a hydraulic radial piston motor to ensure maximum cutting rate and drum torque for optimal production performance and efficiency.
- **Optional concrete bits and water sprinkler kits** are available for all models.
- **Cat XT-3 and medium pressure hose, couplings and O-ring face seals** provide superior, leak-free performance and reliability.
- **Quick coupler** with rugged, opposing edge design holds the work tool securely and allows the operator to quickly change from one high performance Cat Work Tool to another.

**Conical Bits:** Cold planer drums are designed with an optimal bit pattern to provide maximum cutting performance and efficiency, while ensuring superior surface texture. Standard all-purpose tungsten carbide inserted conical bits provide all-purpose planing in most applications.

### Market Opportunities

- **Infrastructure/Heavy Construction** — Skid steer mounted cold planers are frequently used on bridges to remove pavement where large dedicated planers are restricted due to weight.
- **Concrete/Masonry (Including Asphalt/Paving)** — Cold planers are used extensively by paving contractors in urban and rural settings to remove damaged pavement prior to overlay, remove excess pavement, provide specific surface texture (skid resistance), remove traffic lane stripes and re-establish proper draining characteristics of pavement.
- **Governmental/Municipalities (Street and Road Maintenance)** — Cold planers are ideal for urban road and parking lot maintenance departments to remove cracked or deteriorated pavement, milling bumps or imperfections in expanded pavement.

**Cold planers** are highly utilized work tools for specialized applications. They are often used in conjunction with a bucket and broom.

**Features:**

- **Two sizes available:** the 1321 mm (52") working width LT13B and the 1854 mm (73") working width LT18B. Both units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Direct drive system** features two in-line motors that transmit power directly from the drive motor shaft to the tiller shaft. Power to both ends of the shaft eliminates torque twist and increased system performance.
- **Adjustable skid shoes** provide a working depth range of 25-152 mm (1"-6").
- **High strength medium carbon alloy steel tines** are hardened for maximum strength, durability and wear life in the toughest soil conditions.
- **Cat XT-3 hose and O-ring face seals** are used throughout for superior leak-free performance.

**Market Opportunities**

- **Agriculture** — Landscape tillers provide an effective work tool around the farm or orchard to breakup and condition soil prior to planting.
- **Building/General Construction** — Landscape tillers can be used on construction sites to level soil and remove ruts.
- **Landscaping/Landscape Maintenance** — Landscape tillers are ideal for mixing and composting soils for improved seedbeds, soil stabilization and soil preparation prior to landscaping and laying sod.
- **Governmental/Municipalities** — Landscape tillers are ideal for city maintenance departments and parks to recondition, level and stabilize soil after utility work or prior to yearly landscaping.

**Landscape tillers** are productive work tools for specialized applications. They are often used in conjunction with a bucket, landscape rake and auger.

**Features:**

- **Two sizes available:** the 1576 mm (62") working width LR15B and the 1883 mm (74") working width LR18B. Both units efficiently utilize the standard flow auxiliary hydraulic horsepower capabilities of Cat Skid Steer Loaders.
- **Chain reduction drive system** features #80H roller chain for strength and durability, a variable speed unidirectional gerotor motor for maximum performance and cartridge relief valve for system protection.
- **Durable #2060H conveyor chain** provides strength, durability and long life in a variety of soil conditions.
- **High strength medium carbon alloy steel teeth** are hardened for maximum strength, durability and wear life in the toughest soil conditions.
- **Quick dumping capability** is accomplished with a poppet check valve. Once the hopper bucket is full, simply reverse flow to actuate the rake head and dump the bucket.
- **Cat XT-3 hose and O-ring face seals** are used throughout for superior leak-free performance.

**Market Opportunities**

- **Agriculture** — Landscape rakes provide an effective work tool around the farm or nursery to condition, level and remove rock and foreign material from soil prior to planting.
- **Building/General Construction** — Landscape rakes can be used on construction sites to level and remove debris from soil prior to landscaping and seeding.
- **Demolition** — Landscape rakes provide an excellent means to clean up loose material after the demolition work is complete.
- **Landscaping/Landscape Maintenance** — Landscape rakes are ideal for aerating, conditioning, leveling and removing rocks from soil prior to seeding or laying sod. They also are ideal for conditioning and cleaning baseball fields.

Landscape rakes are productive work tools for specialized applications. They are often used in conjunction with a bucket, landscape tiller and auger.

\*Rated struck capacities shown as per ISO 7546: 1983 and SAE J742 FEB85.

**Features:**

- **Dual speed, axial piston hydraulic motor** provides smooth, efficient performance while delivering optimal torque under changing material loads.
- **Rugged mulching head** processes trees up to 200 mm (8 in) diameter for effective forestry clearing applications.
- **Single bolt retention, fixed tooth balanced rotor** provides excellent operating efficiency at high speed. Single bolt retention provides quick tooth replacement.
- **Adjustable push frame** is standard equipment and provides the ability to position trees to allow for optimum cutting and efficiency. In forestry operation it also provides operator cab protection.
- **Pressure gauge** provides operator feedback to adjust speed for maximum productivity in changing material loads. Gauge displays planer performance in real-time conditions and is visible from the cab. Available on XHP models.
- **Heavy-duty bearings** extend work tool life.
- **Hydraulically operated front hood** is standard, allowing trees to be cut when opened and allows dense vegetation to be mulched.
- **Polychain belt drive** provides abrasion resistance, shock load capability and protects against debris blockage.
- **Rear chain guard protection** reduces spread of material.
- **Rigid, robust tempered steel construction** provides fully guarded protection in tough applications.
- **Cat XT-3 ES hose, couplings and O-ring face seals** provide superior, leak-free performance and reliability. All hoses are wrapped with nylon woven cordura sleeving for added operator protection. Hydraulic quick disconnects enable fast tool changes.
- **Quick coupler** with rugged, opposing edge design holds the work tool securely and allows the operator to quickly change from one high performance Cat Work Tool to another.

The **Cat Mulcher** is designed for high-performance cutting, and mulching vegetation and undergrowth from typical forested terrain. The hydraulic mulcher reduces saplings, shrubs and downed trees into mulched material, making it ideal for environmental maintenance, such as creating fire lanes. Other applications include: reclaiming untilled land, removing foliage from building construction sites, and shredding pruned material and organic waste for biomass production.

**Features:**

- **A heavy-duty frame, pivot plate and attachment plate** are featured for reliable operation in rugged terrain and abusive soil conditions.
- **Pure carbide, blunt shaped teeth** create a dimpled sub-surface to ensure the best possible seedbed sub-base fracture pattern.
- **Two-position winged endplates** allow close raking to side walks or foundations. They can remain parallel, even during angling, for smoother plowing.
- **Convenient, heavy-duty, deep skid-resistant step** and a generous cab allow for easy operator entry and exit.
- **Dual independently adjustable gauge wheels** allow for skim passes for over-seeding or adjust to cut drainage grades.
- **Cat XT-3 ES hose, couplings and O-ring face seals** provide superior, leak-free performance and reliability. All hoses are wrapped with nylon woven cordura sleeving for added operator protection. Hydraulic quick disconnects enable fast tool changes.
- **Quick coupler** with rugged, opposing edge design holds the work tool securely and allows the operator to quickly change from one high performance Cat Work Tool to another.

**Cat Power Box Rakes** are ideal for clearing and preparing soil in general construction trench restoration, golf course construction and athletic field maintenance. They offer the versatility to de-thatch, remove old lawns and weeds, grade, level, rake, remove debris and prepare seedbeds with one work tool. Their angling ability allows the operator to windrow collected debris for easy pickup and removal. The consistent milling action creates an ideal seedbed for great germination results, laying the groundwork for a perfect lawn. Wet, dry, weedy, hard and rocky soil can be dried, flattened, pulverized and conditioned for seed in one step.

### Features:

- **Direct drive system** features a variable speed, bidirectional, gerotor style motor that delivers optimal chain speed, chain pull and torque for maximum trenching performance in a broad range of soil types.
- **Durable double standard anti-backflex chain** is standard for strength, durability and long life in all soil types.
- **Standard boom lengths** for all-purpose performance. Replaceable weld-on wear strips extend boom life.
- **Hardfaced, tungsten carbide steel cupped teeth** are standard for long life in many soil conditions. Teeth are spaced for optimum digging performance in most soil.
- **Hydraulic or manual side-shift on the T6B and T9B** provides close trenching flexibility near structures or obstructions.
- **Hydraulic side-shift on the T15B** is controlled from the operator's compartment using the standard flow auxiliary hydraulic circuit selector control.
- **Optional cutting widths and crumber bars** are available for wider trenching requirements and loose material removal.
- **Cat XT-3 hose and O-ring face seals** are used throughout for superior leak-free performance.

### Market Opportunities

- **Agriculture** — Trenchers provide an effective work tool around the farm or nursery to cut trenches for water lines, electrical cables and other utilities.
- **Building/General Construction** — Trenchers are often used on construction sites to cut trenches for plumbing, electrical, telephone and cable television lines.
- **Landscaping/Landscape Maintenance** — Trenchers are popular landscaping work tools when installing irrigation and water sprinkler systems. They can also be used to remove roots that grow too close to buildings or cart paths. Landscapers, golf course maintenance departments and irrigation contractors are prime users.
- **Specialty Trades/Utilities** — Trenchers are excellent work tools for specialty trades and utility contractors that need to bury water and gas pipe, conduit, electrical, telephone and cable television lines.

**Trenchers** are productive work tools for specialized applications. They are often used in conjunction with a bucket and auger.

<sup>2</sup>Max. Flow: T6B, T9B — 80 L/min (21 gpm), T15B — 130 L/min (34 gpm).

**Features:**

- **Caterpillar exclusive vibratory pod design** delivers desired balance between frequency and amplitude to provide a superior matte finish. Pod-style weight housings are factory sealed for longer bearing life and easy serviceability.
- **Higher compaction forces** provide twice the compaction force of the original design requiring fewer passes for greater productivity.
- **Replaceable rubber mounts** isolate vibration and enhance vibratory capabilities.
- **Durable high-strength steel drums** are roll formed and finish welded for a smoother surface and longer life.
- **Pivoting interface** allows the drum to oscillate  $\pm 15^\circ$  and follow the contour of the ground.
- **Cat XT-3 hose and O-ring face seals** are used throughout for superior leak-free performance.

**Market Opportunities**

- **Building/General Construction** — Vibratory compactors can be used on construction sites to level and compact soil around building foundations after backfilling.
- **Governmental/Municipalities (Street and Road Maintenance)** — Vibratory compactors are useful work tools for compacting soil and crushed rock prior to paving or pouring concrete. They are also useful for compacting small areas of asphalt (pothole repair).
- **Landscaping/Landscape Maintenance** — Vibratory compactors are used by landscaping contractors after installing irrigation and water sprinkler systems. Golf course maintenance departments will often use this product to compact greens and fairways.
- **Paving** — Vibratory compactors are used by paving contractors for smaller paving jobs (compacting soil and crushed stone), compacting hot patch (pot hole repair) or compacting material in tight areas where a dedicated roller can't maneuver.
- **Specialty Trades/Utilities** — Vibratory compactors are ideal for compacting back-filled soil after trenching and backhoe work.

**Vibratory compactors** are productive work tools for specialized applications. They are often used in conjunction with a bucket, cold planer and trencher.

**Features:**

- **Pickup Brooms** sweep and deposit material into an integrated hopper bucket for easy removal and dumping. Bidirectional capabilities of the bristles allow Pickup and Utility Brooms to sweep in forward or reverse machine travel. Optimum sweeping style is in forward travel, resulting in over-the-brush pickup. Certain conditions require a dust pan style of sweeping, done in reverse travel.
- **Utility Brooms** sweep and collect light debris on smooth surfaces in forward or reverse travel. They can be adjusted for greater bristle down-force in tough applications such as sweeping course material out of a cold planer cut.
- **Angle Brooms** use a single variable speed, unidirectional gerotor style hydraulic motor, contained in a protective housing. They use a windrowing action to move loose debris ahead and to the side of the surface being swept. They can be oriented straight or angled up to 30° left or right of center in forward travel.
- **Direct drive motors** provide maximum performance and durability. Pickup and Utility Brooms use a single variable speed, bidirectional gerotor style hydraulic motor, contained in a special housing that is adjustable to compensate for bristle wear. Angle brooms use a single variable speed unidirectional gerotor style hydraulic motor contained in a protective housing.
- **Polypropylene/wire convoluted brushes** provide optimum results for sweeping. Optional all-polypropylene and all-steel wire convoluted brushes are available for specialty applications. Convoluted brush sections are available in half-kits for easy maintenance and quick replacement.
- **Drop core design** allows for quick bristle replacement without removing hydraulic hoses.
- **Quick coupler** with rugged, opposing edge design holds the work tool securely and allows the operator to quickly change from one high performance Cat Work Tool to another.

**Market Opportunities**

- **Building/General Construction** — Brooms are often found on construction sites once the construction is complete to remove and collect dirt, rock and other construction debris from driveways, sidewalks and streets.

- **Demolition** — Brooms are ideal for collecting loose dirt and debris from demolition sites.
- **Governmental/Municipalities (Street and Road Maintenance)** — Brooms are useful work tools for cleaning city streets, sidewalks and parking areas. Airport maintenance is another popular application.
- **Industrial/Recycling** — Pickup brooms are excellent for cleaning factory floors or industrial pavements.
- **Landscaping/Landscape Maintenance** — Brooms are used by landscaping contractors to clean paved surfaces after the landscaping is complete. Golf course maintenance departments will often use this product to clean cart paths, parking lots and even turf.
- **Paving** — Pickup brooms are often used by paving contractors to sweep and collect milled asphalt and concrete. Angle brooms are used to clean milled surfaces.
- **Specialty Trades/Utilities** — Brooms are often utilized by specialty trades and utility contractors to clean up after trenching and backhoe work.

**Pickup brooms** are productive work tools for specialized applications. They are often used in conjunction with a bucket, cold planer and trencher.

**Features:**

- **Two direct drive models, the standard flow SG16B and the high flow SG18B** feature a variable speed, unidirectional motor that is matched to the Cat Skid Steer Loader’s auxiliary hydraulic horsepower capabilities. Provides high torque for efficient grinding performance.
- **Heavy-duty 547 mm (21.5") cutting wheel and 32 bolt-on carbide teeth** provide maximum durability and cutting efficiency.
- **Heavy-duty, dual height, pivoting stand feet** provide a stable platform when grinding.
- **Standard hydraulic cutting wheel swing** (full 70 degrees) and extension [280 mm (11 in) max.].
- **Hydraulic depth control on SG18B, depth control on SG16B** is manually adjustable using a 3-position depth control bar.
- **Extension slider rods** are chrome plated for long life.
- **Cat XT-3 and medium pressure hose, couplings and O-Rings.**

**Market Opportunities**

- **Landscaping/Landscaping Maintenance** — Stump grinders are ideal for economically removing tree stumps in residential, commercial and agricultural settings.
- **Rental** — Stump grinders are a high opportunity rental work tool for lawn care and for clean up after natural disasters such as tornadoes and hurricanes where many trees are damaged.

**Stump grinders** are productive work tools for specialized applications. Maneuverability and compact size compared to tow behind stump grinders lend it be to very popular in lawn care and golf course maintenance.

**Machine Compatibility**

Rated structural capacity*	907 kg	<b>2000 lb</b>
Maximum reach (horizontal)**	2134 mm	<b>84"</b>
Weight	127 kg	<b>280 lb</b>

\*Rated structural capacity is the maximum load that can be carried by the work tool and does not imply that the specific host machine has the tipping capacity to lift the load. Refer to the Cat Skid Steer Loader and Multi Terrain Loader Operation and Maintenance Manual (OMM) for Cat Skid Steer Loader and Multi Terrain Loader rated operating capacity with Material Handling Arm.

\*\*Maximum horizontal reach is measured from the front tire with the loader arms approximately 1.5 m (5') off the ground and work tool tilted forward approximately 68 degrees at the end point.

## INTRODUCTION

Draglines are an important excavating tool used in many surface mining operations worldwide. These highly productive machines operate 24 hours a day, seven days a week and are able to reach depths of 79.8 m (262 ft) with capacities up to 116.2 m<sup>3</sup> (152 yd<sup>3</sup>). Offering the lowest material removal cost per tonne (ton) and an average operating life of 40 years, draglines are the most productive and versatile machine in the industry. Caterpillar offers an extensive variety of dragline specifications and on-staff application engineers who will help determine the solution that best addresses specific needs.

With over 100 years of dragline experience and the largest operating fleet of draglines with buckets of 40 m<sup>3</sup> (52.3 yd<sup>3</sup>) and above, coupled with an active installed base of over 300 machines, Cat draglines are the most efficient and proven overburden removal solution.

## SAFETY AND SERVICEABILITY

Safety plays an integral role in everything we do at Caterpillar, from our factory floors to our service centers to our clients' mine sites. Caterpillar's commitment to safety is apparent in our product designs, which undergo risk assessments and are designed to meet strict codes and regulations. Stairways, walkways, platforms and access points are incorporated throughout Cat<sup>®</sup> draglines to ensure safe and convenient access for maintenance personnel. With safety and serviceability enhancing features incorporated into the operator cab, structures, surfaces and electrical equipment, among others, Cat draglines were designed with safety in mind.

## FEATURES

### AC IGBT Electrics

Cat draglines are equipped with AC IGBT electrics which allow for greater machine uptime, lower operating costs, and faster cycle times, with AC providing up to 10% energy savings over the life of the machine.

- **Superior availability:** AC IGBT electric draglines have routinely demonstrated electrical availabilities of greater than 95%.
- **Greater reliability:** Fewer components including interchangeable inverters. IGBT systems require no fuses or circuit breakers.
- **Reduced maintenance:** No regular maintenance is required on IGBT power control modules. Motor maintenance on AC machines is reduced to greasing and replacing bearings every 30,000 hours.
- **Reduced inventory:** Hoist, drag, swing, and propel motions are all controlled by AC motors. Cat IGBT is a mine quality system with rugged welded cabinets to withstand harsh mining conditions.

### Major Structures

Cat major structures are designed for extended performance in harsh mining conditions. Structures are manufactured using impact-resistant, high-strength steel with select welds of full-penetration, profiled and ground type. All structural welds undergo visual inspection, with critical welds also receiving MT, UT or X-ray inspection. Large furnaces are used to stress-relieve entire weldments for reduced susceptibility to cracking. Interiors of finished structures are painted white to facilitate field inspection.

### Tri-Structure Design

The exclusive tri-structure design on Cat draglines reduces front end weight to enable optimization of boom configurations, allowing for increased load and reach. The tri-structure is manufactured with high impact strength steel for a simplified wide flange beam construction, and less maintenance points are required in comparison with an A-frame or mast assembly. Inventory stocking needs are reduced as the sheaves are interchangeable with both the fairlead and boom assemblies.

### Cat Cab

Cat's state-of-the-art operator's cab is the product of a multi-year collaboration between Caterpillar, mining companies and operators. The cab provides industry-leading visibility with excellent line of sight supplemented by five optimally-mounted cameras and display screens. It provides enhanced safety through dual access/egress doors and an optimally-placed trainer seat with independent emergency stop. Additionally, the cab offers the smoothest, most comfortable ride available with an ergonomic, adjustable operator's seat with a fully pneumatic suspension system, low-effort joysticks and dual display screens optimized for operator comfort.

### Custom Design and Aftermarket Support

The Cat dragline model selection process is grounded in analysis and collaboration with experienced application engineering professionals and a dragline optimization process to assist in determining the configuration optimally suited for a particular application. Additionally, mechanical and electrical upgrades, and component rebuilds are available to ensure productivity and reliability for the life of the machine. Caterpillar also offers machine relocation and field assembly services supported by experienced industry experts.

## 10/10/20 LOAD MANAGEMENT POLICY — DRAGLINES

“Machine overload” shall consist of operating the dragline(s) outside of the acceptable allowable load distribution.

The customer shall be responsible for the monitoring and management of all dragline operational activities, including, but not limited to, management of the machine loading such that its loaded distribution is within the acceptable allowable load distribution.

Operating outside of these parameters over any rolling 30 day period can void the customer’s standard warranty; any extended warranty; any availability guarantee and/or result in adjustments to Caterpillar’s obligations under any contract or agreement.

### Loading Distribution

Loading use over any rolling 30 Day period analyzed:

- No more than 10% of loads should exceed 110% of rated payload.
- No load should exceed 120% of rated payload.
- The average of all loads for the unit must at least equal the rated payload.

### KEY

- 90% of loads should fall into this range.
- No more than 10% of loads should exceed 110% of the target payload.
- No loads should be above 120% of the target payload.

Loading use in excess of this prescribed distribution is considered “machine overload.”

### Notes

- For this policy to be in effect, the “operational cycle” payload feedback must be available to the operator in order that the customer can control actual payloads.
- Customer must procure, install, and use AccessDirect™, MIDAS, and Accuload, and the data must be provided to Caterpillar unmodified and unencumbered.
- Caterpillar must be notified in a timely fashion if the payload monitoring and feedback system is out of service.

## INTRODUCTION

Electric rope shovels are one of the largest loading tools on the market. They run in a truck-shovel operation with mining trucks in order to move large quantities of material at a low cost per ton. Electric rope shovels are used to mine a variety of minerals including oil sands, coal overburden, copper, gold, iron ore, etc. They operate in extreme climates in tough surface mining applications all over the world. With over 85 years' experience in the rope shovel industry, and an active population of nearly 250 machines, Cat Electric Rope Shovels are the most efficient and cost effective loading tools available.

## SAFETY AND SERVICEABILITY

Safety plays an integral role in everything we do at Caterpillar, from our factory floors to our service centers to our clients' mine sites. Caterpillar's commitment to safety is apparent in our product designs, which undergo risk assessments and are designed to meet strict codes and regulations.

Stairways, walkways, platforms and access points are incorporated throughout Cat Electric Rope Shovels to ensure safe and convenient access for maintenance personnel. With safety and serviceability enhancing features incorporated into the operator cab, structures, and electrical equipment, among others, Cat Electric Rope Shovels were designed with safety in mind.

## FEATURES

### AC IGBT Electronics

With over 30 years of AC experience and over 200 operating AC machines, Bucyrus led the industry in AC electric rope shovels. Caterpillar continues to carry on this proud tradition. Since its launch in 1981, the AC electric rope shovel has gained strong industry acceptance, offering:

- **Superior availability:** AC IGBT electric rope shovels have routinely demonstrated electrical availabilities of greater than 98%.
- **Greater reliability:** Fewer components including interchangeable inverters. IGBT systems require no fuses or circuit breakers.
- **Reduced maintenance:** No regular maintenance is required on IGBT power control modules. Motor maintenance on AC machines is reduced to greasing and replacing bearings every 30,000 hours.
- **Durability:** Cat IGBT is a mine quality system with rugged welded cabinets to withstand harsh mining conditions.
- **Reduced inventory:** One IGBT part number is used in multiple locations allowing for decreased component inventory.

### Major Structures

Cat major structures are designed for extended performance in harsh mining conditions. Structures are manufactured using cold-weather, impact-resistant, high-strength steel with select welds of full-penetration, profiled and ground type. All structural welds undergo visual inspection, with critical welds also receiving MT, UT or X-ray inspection. Large furnaces are used to stress-relieve entire weldments for reduced susceptibility to cracking. Interiors of finished structures are painted white to facilitate field inspection.

### Robust Front End Design

The Cat crowd/retract system design presents many benefits over traditional rack-and-pinions systems, including:

- **Fast swing times:** The Cat deck-mounted, rather than boom-mounted, crowd machinery greatly reduces front end weight for reduced swing inertia and fast swing times.
- **Elimination of torsional loading:** The free-floating tubular handle design allows the Cat handle to rotate under uneven loading, transferring force into the ropes rather than into the boom.
- **Superior visibility:** With deck-mounted crowd machinery, Cat machines provide operators with a clear left-hand line of sight for higher visibility and enhanced safety.
- **Efficient digging:** Wide-set boom point sheaves stabilize the dipper as it engages the bank for easier and more efficient digging.

### Cat Cab

Caterpillar's state-of-the-art operator's cab is the product of a multi-year collaboration between Caterpillar, mining companies and shovel operators. The cab provides industry-leading visibility supplemented by five optimally-mounted cameras and display screens. It provides enhanced safety through dual access/egress doors and an optimally-placed trainer seat with independent emergency stop. Additionally, the cab offers the smoothest, most comfortable ride available with an ergonomic, adjustable operator's seat with a fully pneumatic suspension system, low-effort joysticks and dual display screens optimized for operator comfort.

### Power Demand Management System

Caterpillar's exclusive Power Demand Management System for 7495 Series machines allows an electric rope shovel to operate efficiently in spite of electrical infrastructure challenges. This patented energy storage and power management technology reduces the number of generators required to run an electric rope shovel, giving mines the option of production without grid power. Additionally, this technology lowers the machine's peak power requirement, resulting in more alternatives when mines plan for power.

### HydraCrowd™

HydraCrowd represents the first new crowd technology developed in the past 70 years. A hydraulic cylinder inside the tubular dipper handle maintains all the benefits of the Cat front end while eliminating the need for routine crowd/retract rope replacements. HydraCrowd cuts downtime by reducing the number of maintenance events needed to keep the machine operational. HydraCrowd is controlled with proven Cat IGBT technology and has complete diagnostic and troubleshooting information with step-by-step instructions. This technology is currently under a controlled release.

**LatchFree™**

The LatchFree Dipper System is Caterpillar's solution to customers' number one cause of downtime — the traditional latch assembly. The LatchFree dipper eliminates the latch assembly, replacing it with a strong steel link mounted to the dipper back, away from material flow. The system enhances safety by reducing the number of maintenance events required to maintain the system and increases reliability by reducing unplanned downtime. The LatchFree Dipper System comes complete with a comprehensive training program to ensure customers achieve maximum system benefits, and is currently under a controlled release.

**FastFil™ Dipper Design**

The unique FastFil dipper provides customers with faster and fuller dipper loads where the application permits. Its trapezoidal shape accommodates the natural configuration of the load, eliminating voids that occur with box-shaped dippers for improved fill factors. The trapezoidal shape also optimizes dipper size and weight for improved maneuverability and faster swing times. Additionally, an adjustable pitch brace allows rake angle changes to improve bank penetration, eliminate bulldozing, and improve productivity. Combined, the FastFil features maximize the fill factor.

**Operator Assist — Enhanced Motion Control**

The operator assist — enhanced motion control system eliminates or reduces the occurrence of crowd over-speeds, crowd impacts, hoist stalls, boom jacking, and swinging while engaged in the bank. This is accomplished by intelligently controlling how motions are allowed to operate under certain conditions. The reduced system stress and equal or better cycle times improve shovel performance and cost per ton. This software is standard on all 7495 Series electric rope shovels.

**AccessDirect**

AccessDirect is an electrical interface system that facilitates remote access to a machine's onboard computer via the Internet. With AccessDirect, maintenance personnel can analyze faults from off-site locations and arrive on-site prepared to resolve issues, leading to reduced machine downtime. AccessDirect also enables factory experts to remotely access and troubleshoot faults, resulting in superior response times and reduced mean time to repair.

**AccuLoad**

AccuLoad is a data analysis system that provides real-time feedback on dipper loads. AccuLoad's payload calculation is accomplished without mechanical sensors, eliminating the need for recalibration, which is a common problem with other load weighing systems. The system can be employed to calculate material moved, to monitor overloading of trucks, or to allow operators to study their loading efficiency and shift performance. It can also log operator performance data which, when paired with MIDAS, can generate reports to help identify training opportunities to increase shift production.

**MIDAS**

The MIDAS health monitoring system continues to optimize machine performance by providing, logging and analyzing data on a variety of machine variables. MIDAS comes complete with a built-in report generator that outputs data in a format that can be easily analyzed to identify opportunities to improve machine performance. When paired with AccessDirect and AccuLoad, MIDAS provides real-time monitoring of shovel operation and provides users with a 3D model to watch the shovel in motion.

**GROUND BEARING PRESSURE**

Ground bearing pressure, or the amount of weight that can be supported by ground conditions, determines the link width (and occasionally the machine model) that can be used at a mine site. Softer ground conditions require wider links while the softest conditions (i.e. oil sands) require a specific model (7495 HF) which was

designed to operate under low ground bearing pressure conditions. A link too narrow for the application may even cause the crawlers to sink into the ground.

The chart below lists the link length options for each electric rope shovel model as well as the corresponding minimum ground bearing pressures.

<b>MODEL</b>	<b>7295<sup>1</sup></b>		<b>7395<sup>2</sup></b>		<b>7495 HD<sup>3</sup></b>		<b>7495<sup>4</sup></b>

All dimensions are approximate.

**DIPPER SELECTION**

Selecting the correct dipper size plays an integral role in maximizing productivity from a truck shovel operation. Optimal dipper size is a function of truck size, material loose density, and fill factor.

The first step in calculating dipper size is to determine the machine’s optimal payload based on truck size. To calculate this, divide truck payload by three and four (three or four pass even loading is ideal for high productivity). Compare these values to the machine’s maximum payload. The machine’s optimal payload is the largest value that is less than the maximum payload.

For example, consider a mine operating a 7495 shovel (maximum payload = 120 tons) and 797 trucks (payload = 400 tons).  $400 \div 3 = 133.3$  and  $400 \div 4 = 100$ . 133.3 can be eliminated as it is greater than the shovel’s maximum payload (120 tons). 100 tons is the largest value less than the machine’s maximum payload, and therefore, is the machine’s optimal payload.

Once optimal machine payload is determined, material loose density and fill factor are used to calculate the optimum dipper size. To calculate material loose density, divide insitu (undisturbed material density) by  $1 + \text{swell factor}$ .

$$\text{Material loose density} = \frac{\text{Insitu}}{(1 + \text{swell factor})}$$

Once material loose density is calculated, use the equation below to find the optimal dipper size. Fill factor is affected by the dipper geometry, rake angle, and material properties, including fragmentation and critical angle of repose. Fill factors are generally between 90% and 115% for efficiently-sized dippers.

$$\text{Optimal dipper size} = \frac{\text{Optimal machine payload}}{\text{Material loose density}} \times \text{Fill factor}$$

*For example:* For a mine with the following conditions:

- Insitu: 2.276 ton/yd<sup>3</sup>
- Swell factor: 35%
- Fill factor: 95%
- Optimal machine payload: 100 tons

$$\text{Optimal dipper size} = \frac{100 \text{ tons}}{2.276 \div (1 + 0.35)} \times .95 = 62.5 \text{ yd}^3$$

<b>MODEL</b>	<b>7295</b>		<b>7395</b>		<b>7495 HD</b>		<b>7495</b>	
Dipper Range	19.1- 38.2 m <sup>3</sup>	<b>25- 50 yd<sup>3</sup></b>	20.6- 55.8 m <sup>3</sup>	<b>27- 73 yd<sup>3</sup></b>	27.5- 60.4 m <sup>3</sup>	<b>36- 79 yd<sup>3</sup></b>	30.6- 62.7 m <sup>3</sup>	<b>40- 82 yd<sup>3</sup></b>

## TRUCK MATCH

Truck shovel match, or the number of passes necessary to load a truck, has a major impact on an operation's

productivity. To optimize productivity, 3 to 4 even pass loading of trucks is ideal. The chart below shows pass match between Cat electric rope shovels and Cat trucks.

MODEL	Payload	7295	7395	7495 HD	7495	7495 HF
	tonne (ton)	45 (50)	64 (70)	82 (90)	109* (120*)	109* (120*)
785D	136 (150)	3				
789D	181 (200)	4	3			
MT4400D AC	221 (244)		4	3		
793F	227 (250)		4	3		
794 AC	291 (320)			4	3	3
795F AC	313 (345)			4	3	3
797F	363 (400)				4	4

\*Indicates maximum payload.

## RATED SUSPENDED LOAD

Rated Suspended Load is the designed maximum load limit for any Cat Electric Rope Shovel (ERS) model/machine serial number. The maximum load limit is defined as the combined total of Dipper Weight plus Struck Payload Weight.

- **Dipper Weight:** Dipper Weight is the combined total dead weights of dipper body, GET, lip and corner shrouds, dipper door, door latch assembly, wear liner packages for body and door, snubbers, pitch braces, padlocks and pins/pin retainers. (**Note:** Handle weight is NOT included in calculation of Dipper Weight.)
- **Struck Payload Weight:** Struck Payload Weight is the live weight of the material in the dipper. This is a calculated payload weight based on the struck volume of the dipper multiplied by the density of the loose material in the dipper.

Struck volume of a dipper is the contained interior volume of the dipper from the closed door up to the plane of a straight line from the front edge of the dipper back (top) to a point on the dipper lip (floor) where the teeth are attached.

The below values for Rated Suspended Loads (RSL) for Cat Electric Rope Shovels are applicable to shovels commissioned on or after June 1, 2016. Since Cat Electric Rope Shovels have seen numerous upgrades throughout their history which will affect shovel capability, a Rated Suspended Load (RSL) value based on the specific configuration of each machine is more appropriate for machines manufactured or commissioned prior to that date.

ERS MODEL	Rated Suspended Load (RSL)	
7295	81 647 kg	<b>180,000 lb</b>
7395	117 934 kg	<b>260,000 lb</b>
7495 HD	154 221 kg	<b>340,000 lb</b>
7495 with 100 tonnes (110 short tons) Payload	185 973 kg	<b>410,000 lb</b>
7495 HF with 100 tonnes (110 short tons) Payload	185 973 kg	<b>410,000 lb</b>
7495 with 109 tonnes (120 short tons) Payload	195 045 kg	<b>430,000 lb</b>
7495 HF with 109 tonnes (120 short tons) Payload	195 045 kg	<b>430,000 lb</b>

**10/10/20 LOAD MANAGEMENT POLICY —  
ELECTRIC ROPE SHOVELS**

“Machine overload” shall consist of operating the shovel(s) outside of the acceptable allowable load distribution.

The customer shall be responsible for the monitoring and management of all shovel operational activities, including, but not limited to, management of the machine loading such that its loaded distribution is within the acceptable allowable load distribution.

Operating outside of these parameters over any rolling 30 day period can void the customer’s standard warranty; any extended warranty; any availability guarantee and/or result in adjustments to Caterpillar’s obligations under any contract or agreement.

**Loading Distribution**

Loading use over any rolling 30 Day period analyzed:

- No more than 10% of loads should exceed 110% of rated payload.
- No load should exceed 120% of rated payload.
- The average of all loads for the unit not to exceed the rated payload.

**KEY**

- 90% of loads should fall into this range.
- No more than 10% of loads should exceed 110% of the target payload.
- No loads should be above 120% of the target payload.

Loading use in excess of this prescribed distribution is considered “machine overload.”

**Notes**

- For this policy to be in effect, the “operational cycle” payload feedback must be available to the operator in order that the customer can control actual payloads.
- Customer must procure, install, and use AccessDirect, MIDAS, and Accuload, and the data must be provided to Caterpillar unmodified and unencumbered.
- Caterpillar must be notified in a timely fashion if the payload monitoring and feedback system is out of service.

## GENERAL INTRODUCTION

### Hydraulic Mining Shovels

Hydraulic mining shovels are designed to move large volumes of materials, and the majority are employed in the mining industry for loading large Mining and Off-Highway Trucks. Key design characteristics are high digging forces and quick working cycles for best performance, and a durable design to handle severe working conditions. Hydraulic mining shovels dig and load various commodities, such as gold, copper, iron ore, diamonds and coal, or they remove overburden, in any climatic condition around the world. Typically operated around the clock, Hydraulic Mining Shovels accumulate up to 6500 hours per year.

### Nomenclature

The 6000 Series constitutes the Cat hydraulic mining shovel product line. The name of each individual model gives a direct reference to the size of the machine and consists of a four-digit number, plus additional capital letters in specific cases, depending on the particular drive system and attachment configuration.

The first digit designates the 6000 Series and is followed by another three digits indicating the approximate bucket payload of that model in metric tonnes. Without any extra letters, the specific model is a diesel driven hydraulic mining shovel with a backhoe attachment. If the machine has a front shovel attachment with diesel drive, the letters “FS,” are added to the four-digit number, separated by a space character. An electrically driven hydraulic mining shovel will show an inserted “AC” after the four-digit number. For instance a 6030 FS is a front shovel with a payload of approximately 30 metric tonnes and diesel engines.

The following table gives a summary of all versions currently available.

Diesel Drive		Electric Drive	
Backhoe	Front Shovel	Backhoe	Front Shovel
6015B	N/A	N/A	N/A
6020B	N/A	N/A	N/A
6030	6030 FS	6030 AC	6030 AC FS
6040	6040 FS	6040 AC	6040 AC FS
6050	6050 FS	6050 AC	6050 AC FS
6060	6060 FS	6060 AC	6060 AC FS
N/A	6090 FS	N/A	6090 AC FS

N/A = Not Available

### Technical Specifications

All data given herewith is subject to change. The specs/sheets for individual models may have been updated after publishing of this Performance Handbook edition.

### Contact Details

If there are any questions or comments regarding the information on hydraulic mining shovels given in this chapter please contact:

*Boernke\_Volker@cat.com* or  
*Tegtmeier\_Dirk@cat.com*

### TriPower

On all face shovel (FS) models, Caterpillar uses a unique boom design, called TriPower, that employs rotatable triangular rockers to generate superior mechanical leverage and control. This unique Caterpillar design results in:

- Increased effective lifting force
- Constant boom momentum
- Automatic constant bucket angle position in horizontal and vertical direction
- Automatic roll-back limiter

Furthermore, the TriPower system enables Cat hydraulic front shovels to use smaller-diameter boom cylinders. This benefit results in faster lifting speeds.

### Superior Oil Cooling System

From 6020B up to 6090 FS the independent oil cooling system utilizes dedicated pumps to provide cooling capacity as needed, whether the engine is idling or under load, whereas conventional cooling systems only provide cooling when the engine is under load and the machine is working. Consequently, on above Cat hydraulic mining shovels, the hydraulic oil circulates through the cooling system even when the machine is waiting for the next truck. This system provides a more efficient means of cooling, particularly in demanding applications. The radiator fan speed is thermostatically or electronically controlled for greater efficiency.

### Closed-Loop Swing Circuit

The Cat closed-loop swing circuit results in fast boom lift motions during swing. The kinetic energy of the swing motion is used during deceleration to support driving the main and auxiliary pumps. Compared to conventional open circuit systems, the Cat closed-loop swing circuit is more energy-efficient, generates less heat and delivers faster speeds.

The new 6020B includes an open-loop swing circuit due to its newly designed advanced hydraulics. Utilizing patent-pending dedicated pump flow allocation technology, hydraulic pumps are allocated to individual circuits on demand, allowing all produced oil flow to be translated into cylinder motion, minimizing hydraulic inefficiencies and heat generation. To fully leverage the advantages of this innovative technology, the open-loop swing system was incorporated for its use of a common set of pumps to serve all functions and the flexibility it offers for utilization of hydraulic flow.

### Simple and Efficient Hydraulic System

From 6020B up to 6090 FS the main hydraulic valve block is located on top of the boom. This design reduces the total number of hoses that are needed and ensures they are neatly organized for safe operation, easy inspection and fast service. Because float valves are used to lower the boom instead of engaging pumps, the boom moves faster and other operating functions can occur simultaneously, such as bucket curl and stick in/out. This results in faster cycle times.

### Monitoring and Diagnostic System

Enhancing diagnostic capabilities and providing detailed troubleshooting functions, the Board Control System uses sensors throughout the machine to monitor operating data, record faults, and notify the operator audibly and visually. This promotes the earliest possible detection of faults and allows for timely maintenance planning and assistance for speedy repair.

### Machine Accessibility

Systems throughout Cat hydraulic mining shovels are designed for easy access, enhancing serviceability.

- **Hydraulic Valve Block** — The valve block is located on the boom where it's cleanly laid out and easily accessed by walkways on both sides. This reduces the number of hoses leading from the superstructure.
- **Superstructure** — Exceptional accessibility is provided to systems like the swing motor, swing gearbox and rotary distributor in the well-organized superstructure. The engine is accessible from three sides on most models.

MODEL	6015B		6020B	
Total Flywheel Power: Net	556 kW	<b>746 hp</b>	778 kW	<b>1043 hp</b>

**GROUND PRESSURE**

The ground pressure specifies the specific weight load transferred to the surface, and can be an indicator for the stability against subsidence. Though such conditions typically apply to smaller excavators in heavy earthmoving operations, there could be rare instances where this may apply in mining applications. Nevertheless, the vast majority of hydraulic mining shovels are delivered with standard track shoes.

The value is determined by setting the machine weight force in relation to the ground contact area of the tracks.

**Ground Contact Area**

**Keys**

- A = Width of standard track shoe
- B = Track length, idler center to sprocket center
- C = Overall track length, grouser bar to grouser bar

To define the ground contact area on soft ground the following formula is applied:

$$2 \times A \times (B + (C - B) \times 0.35)$$

**Optional Track Pads**

In addition to the standard track shoes, optional track pads with different widths are available; however, these optional track pads are only procured on machine orders, and may therefore effect the lead time of the entire hydraulic mining shovel. Furthermore, a front shovel (FS) configured machine equipped with wider track pads increases the risk of track pad damage from bucket strikes.

## BUCKET SELECTION

For the durability and life expectancy of hydraulic mining shovels, it is important to choose the correct bucket size based on the maximum loose density of the material to be loaded. Different bucket volumes for common material densities are available for most models. A loose density of  $1.8 \text{ t/m}^3$  ( $3030 \text{ lb/yd}^3$ ) is considered standard density and the respective bucket volume is suitable for the majority of applications. Additional volumes are offered in staggered increments of  $0.2 \text{ t/m}^3$  ( $340 \text{ lb/yd}^3$ ) and most of them are for heavier material.

### Rated Bucket Capacity

Basically, the total volume is a combination of the struck capacity plus a heap on top of it. On hydraulic mining shovels, the rated bucket capacity is calculated with a different angle of repose for the heap of backhoe buckets versus that of face shovel buckets. As the kinematics on backhoe machines allow for larger bucket tilt angles, steeper heaps are achieved compared to face shovel buckets. Therefore, the nominal bucket capacity is calculated on backhoe buckets with a heap of 1:1, and on face shovel buckets with a heap of 2:1 as shown exemplary in the adjacent sketch.

The following standards have been used to determine the rated bucket capacity:

ISO 7451 for backhoe buckets

ISO 7546 for face shovel buckets

### Practical Bucket Capacity

Under real working conditions, the actual achieved bucket volume, over time, is generally lower when compared to the rated capacity. This is dependent upon various factors, such as fragmentation, bench or face height and humidity. An experienced, well-trained operator achieves between 90 to 95% in reasonably blasted material.

### CYCLE TIMES

The cycle time of a hydraulic mining shovel is an important productivity factor, and a key driver for high or low performance. There are two main areas that influence cycle times. One factor is the pure technical capability of the hydraulic mining shovel. The engine output and associated hydraulic power defines the maximum available oil flow, which consequently determines the speed of the hydraulic cylinders and swing drives, and ultimately the achievable working speed of the machine. The other factor is site specific parameters, such as operator skill, bench height (in particular for hydraulic front shovels), and swing angle, will impact cycle times considerably. Material fragmentation and penetration resistance make a big difference, as well.

Large hydraulic mining shovels are used as the prime mover in most applications. Therefore, the set-up of the loading area is pre-considered to be favorable for productive loading conditions when defining cycle times. Those are for example:

	For backhoe machines	For face shovel machines
Truck position	lower level	same level
Average swing angle	60°–90°	90°
Bench height	similar to stick length	75% of max. reach height

A complete working cycle of a hydraulic mining shovel can be separated into four segments:

- Bucket fill
- Swing loaded
- Dump
- Swing empty

However, the bucket fill process constitutes the main fraction of the loading cycle, with a portion between 40% and 50% of the total time. This is heavily influenced by the material parameters, therefore, the different cycle times, shown for each model in the attached diagram, only consider the increasing effort to fill the bucket:

- **Ideal loading conditions** — Loose material, such as dry sand, soil and gravel, or re-handled or tipped material with no effort to achieve a good fill. Bucket can penetrate anywhere in the face or pile without resistance.
- **Average loading conditions** — Soft overburden with low grade of compaction, and well-shot material with good and consistent fragmentation. Operator doesn't have to concentrate on loosening or finding the right spot for penetration.
- **Fair digging conditions** — Shot rock with partially interlocked sections, or compacted overburden, requiring some effort to loosen the material.
- **Difficult digging conditions** — Inhomogeneous shot rock with some oversized boulders and interlocking, or unblasted material. Also free digging applications in sediment type of rock with fractures and layers which allow to penetrate the material. Considerable effort required to break out material.
- **Severe digging conditions** — Poorly shot rock with a large amount of oversized boulders and/or heavily interlocked material in the majority of the face. Also free digging operations with high digging resistance. In those conditions neither cycle times nor bucket fills are predictable.

Cycle Time Estimating Chart

Key

**NOTE:** The cycle times mentioned above are a guideline under the described application conditions.

Actual achievable cycle times depend on site specific conditions.

## **PRODUCTION OVERVIEWS**

As with any other piece of material handling equipment, the productivity of a hydraulic mining shovel depends on various aspects. These influencing factors are either defined by pure machine specifications, such as bucket capacity, or by application conditions and operator skills, like bucket fill factor and cycle time. In addition, there are parameters, which fall neither under the hydraulic mining shovel's physical capabilities, nor can they be controlled by the shovel operator or the set-up of the loading area. The major factors in this category are truck exchange time and overall mine efficiency.

The following tables indicate, for a typical hydraulic mining shovel/truck combination, the wide range of productivity figures in t/h (tons/h) under various conditions. The overall mine efficiency starts at 83%, which corresponds to 50 minutes per hour. This efficiency is generally achievable only during a short period of time, and could be the relevant factor for a short time production test. However, in the long-run, the overall mine efficiency tends to be in the 65% to 75% range. The grey highlighted area illustrates average productivity figures which can be expected under typical site conditions in well organized mines.

Furthermore, the size of the truck, and the required number of passes to load it, has an effect on hydraulic mining shovel productivity. The larger the truck, the higher the hydraulic mining shovel's productivity will be, because unproductive truck exchange time will be reduced.

The figures in the following tables given in t/h (tons/h) means the production per net loading hour and not per service meter units [SMU].

MODEL: 6015B ● Bucket Size: 8.1 m<sup>3</sup> ● Number of Cycles: 4 ● Material Density: 1.80 t/m<sup>3</sup>

# TELESCOPIC HANDLERS

## CONTENTS

Features . . . . .	17-1
Specifications . . . . .	17-2
Performance Data . . . . .	17-14
Shipping Dimensions . . . . .	17-31
Work Tools . . . . .	17-34
Compatibility . . . . .	17-40

### Features:

- **Intuitive control layout** enables efficient and comfortable operation.
- **Hydraulic system** enables the use of work tools requiring both intermittent and continuous auxiliary hydraulic flows.
- **Range of lift heights and load capacities** from 2500 kg (5500 lb) to 5443 kg (12,000 lb) capacity and 5.6 m (18'4") to 17.3 m (56'9") lift height.
- **Cat® Telehandlers offer extended reach** to easily enable material to be placed over onsite obstacles.
- **Three steering modes and tight turning circles** allow simplified movement onsite and therefore increased productivity.
- **Cat Telehandlers have engine options** which either meet U.S. EPA Tier 4 Final/EU Stage IV/Japan 2014 (Tier 4 Final) emission standards, Tier 4 Interim/EU Stage IIIB/Japan 2011 (Tier 4 Interim) equivalent emission standards, or Tier 3/Stage IIIA/Japan 2006 (Tier 3) equivalent emission standards.

- **Three transmissions options are available on telehandlers.** The TH255 is fitted with a hydrostatic transmission. The TL and TH range are fitted with 4 speed powershift transmissions. The high horsepower TH range is fitted with 6 speed powershift transmissions.
- **Three types of quick couplers are offered on the various telehandler models.** The TH255 is fitted with a universal skid steer loader style coupler enabling the use of many SSL work tools. The TL and TH lines of telehandlers offer hydraulic and manual style IT interface couplers which provide excellent work tool compatibility with older models of telehandlers and other products (for example Backhoe Loaders and Small Wheel Loaders).
- **Three auxiliary hydraulic options** are available: one auxiliary hydraulic service, two auxiliary hydraulic services and continuous hydraulic flow. These options allow maximum work tool utilization.
- **Daily maintenance** consists of only a walkaround inspection, all major components and service points are located at ground level, providing excellent ease of service.

## Features common to all D Series models (953D-963D-973D):

- **Improved serviceability.** All D Series Track-Type Loaders are equipped with a tiltable cab that allows complete service of the hydraulic system. Most daily maintenance checks are performed from the machine's right side, facilitating quick start up. Easy access to major components enhances serviceability and increase uptime.
- **Operator station.** Experience a high level of efficiency, comfort and productivity with the new D Series cab. The cab features a new gauge cluster, a fully air-suspension seat, the new seat mounted controls, an automatic air climate control and provides excellent visibility.
- **Messenger.** Messenger is a new electronic monitoring system with real time, visual feedback on engine and machine operating conditions. It provides information on diagnostic data, maintenance, and allows operating settings such as implement reactions.
- **Hydrostatic drive.** The closed loop hydrostatic drive with electronic control provides precise modulation for quick, smooth operation and superior maneuverability. Shorter cycle times, high efficiency, and excellent maneuverability results in increased productivity.

**Features common to all D Series models (953D-963D-973D) (continued):**

- **Steering controls.** All D Series Track Loaders are offered with a choice of either the traditional V-lever with pedal steering or joystick control. With joystick control both steering and transmission functions are managed using the joystick. The joystick handles includes three buttons. The yellow buttons are used to increase/decrease the travel speed of the machine. The black button activates the horn. There are four different settings for both forward and reverse with the speed displayed on the multifunctional dashboard. This pattern is commonly referred to as S-pattern steering. All Cat® D Series Track-Type Loaders (953D – 963D – 973D) provide the option of two different transmission control joystick configurations. All machines ship from the factory with the default S-Pattern like a Cat Skid Steer Loader. After the machine arrives at the dealership, it can be changed to C-Pattern by the Cat Electronic Technician service tool if required.
- **Electro-hydraulic implements controls.** The new electro-hydraulic implement controls provide the operator with responsive, smooth and precise control of bucket and lift arms.
- **Kickout settings.** Automatic kickouts are part of the electro-hydraulic controls; adjust from inside the cab with a simple rocker switch. Kickout stops are hydraulically cushioned for greater operator comfort and less material spillage.
- **Position Sensing Cylinder.** The D Series has electro-hydraulic implement controls for lower operator effort. The new position sensing cylinders allow setting detents at any positions from the cab. They feature also a load sensing implement pump which reduces engine power consumption.
- **Hydraulic on-demand fan.** The fan is a hydraulic demand type one with optional reversible function, operating in sucker mode. It gives the best efficiency and avoids also sucking the dust and debris coming from the outside into the cooling package.
- **Oscillating track roller frames** decrease ground shock, increase machine stability and improve traction.
- **Unmatched versatility** – excavates, loads, dozes, grades, clears, strips, backfills in all underfoot conditions including those that could damage tires.
- **Sound-suppressed, air-pressurized, resiliently mounted ROPS cab** for superior working environment.
- **Sealed loader linkage** extends lubrication intervals and reduces maintenance time.
- **Automatic bucket controls** let bucket rise to pre-set dumping height and return to pre-set digging angle for fast cycle time.
- **General Purpose and Multi-Purpose** buckets, quick couplers and many other work tools are available to increase versatility.
- **Rippers** are Multishank with wide beam coverage for utility ripping close to walls, footings and embankments. Three shanks are available for D Series Track Loaders.
- **Product Link™ System** reports machine location and hours and consequently makes the maintenance easier and reduces the downtime. Please check availability with your local dealer.
- **Cat Machine Security System** allows better machine protection by preventing theft. A microchip is embedded in the key to provide more security. Cat Machine Security System is an optional feature.
- **K System** is a Caterpillar exclusive which allows ease of installation and removal. New adapters provide better performance and offer a longer lasting life than J Series (+30%).
- **Special Application Arrangements.** Special arrangements — Waste Handling, Demolition, Wide Gauge and more, are available or can be designed on request, to allow the D Series to work in special applications.

**Features of 953D-963D:**

- **C6.6 ACERT™ Engine.** The Cat C6.6 ACERT engine utilizes the Cat Common Rail fuel delivery system. Designed for performance, durability, serviceability, and fuel economy, it meets U.S. EPA Tier 3, EU Stage IIIA and Japan 2006 (Tier 3) equivalent emission standards.
- **SystemOne™ Moving U/C.** The revolutionary Cat SystemOne Undercarriage provides maximum undercarriage life and reliability no matter the application, environment or underfoot conditions. Built to last longer and require less maintenance it ensures a dramatic drop in owning and operating costs.
- **Special Application Arrangements.** Ship Hold Arrangements are available on 953D-963D.

**Features of 973D:**

- **C9 ACERT Engine.** The Cat C9 ACERT engine is an 8.8 liter (537 in<sup>3</sup>) displacement, six-cylinder, in-line configured engine with hydraulically actuated electronic fuel injection or HEUI™. The 196 kW (263 hp) rated net power engine meets U.S. EPA Tier 3, EU Stage IIIA and Japan 2006 (Tier 3) equivalent emission standards.
- **Rear engine location** provides natural stability as a “working” counterweight, excellent visibility and good weight to horsepower ratio.
- **Electronic hydrostatic drive train with pedal steering** offers independent control of each track. Power turns, counterrotation infinitely variable speeds, and fast acceleration for increased maneuverability and production.
- **Variable displacement pump and motors** provide excellent efficiency and controllability.
- **Z-bar linkage** provides increased breakout force, fewer grease points and fast dump speed.
- **Special arrangements** including Wide Gauge, Waste Handling, Ship Hold, Tunneling and Steel Mill are available to tailor the machine to specific applications.
- **Special Application Arrangements.** The steel mill arrangement protects the 973D and its operator against extreme conditions to allow the machine to handle hot slag in steel mill operations. The special arrangement features additional guarding for critical components, sealed undercarriage, heat shields for fuel tank, power train and hydraulics, silicone seals and heat resistant windshield, remote parking brake release and fire-resistant fluids. The Steel Mill Arrangement provides the best protection available for this extremely difficult application.

**Features of 953K-963K:**

- **Fuel efficiency.** A more fuel efficient Cat C7.1 ACERT engine and Eco Mode combine to give you a 10-30 percent reduction in fuel use.\*
- **Performance.** Smarter power train management gives you power when you need it and improved implement and steering response.\*
- **Ease of operation.** Cab updates offer added comfort and convenience for operators. New handles and steps make access/egress even easier from the front or the back of the tracks.
- **Technology.** Remote monitoring with Product Link/VisionLink® helps you manage your fleet more effectively and profitably.
- **Engine.** A Cat C7.1 ACERT engine gives you the power and reliability you need to get the job done. The engine is equipped with a twin turbo, providing faster machine response under load.
- **Fuel efficiency/Eco Mode.** The more efficient engine and an Eco Mode combine to deliver a 10-30 percent reduction in fuel consumption compared to the 963D. Eco Mode automatically reduces engine speed, but maintains selected ground speed under lighter loads. Efficient use of Diesel Exhaust Fluid (DEF) — typically 2.5-3 percent of fuel consumption — provides excellent overall fluid efficiency.

\*Compared to the 953D or 963D.

- **Hydrostatic drive.** A new Electronic Control Module gives you smarter power train management, resulting in smoother implement/steering response and improved steering performance over the previous model. Power reaches the ground more efficiently based on the demands of the application, giving you fast acceleration and shorter cycle times. The electronically controlled Hystat drive uses variable displacement pumps and drive motors to power each track independently, delivering fast acceleration and infinitely variable speed. The operator can command smooth machine turns and counterrotation.
- **Cooling system.** The single unit cooling system incorporates the radiator, air-to-air aftercooler, oil cooler and fan installation. The cooling module is located at the rear of the loader, away from dust and debris stirred up by the bucket while the machine is working. The radiator has 6.5 fins per inch to help reduce plugging. A simple, side-by-side design reduces debris and makes cleaning easier. The fold-down design gives you easy access.  
  
A hydraulic demand fan reduces speed in cooler conditions to conserve power, save fuel and decrease sound levels. An optional reversing fan is available for high debris conditions.
- **Load-sensing hydraulics.** Field-proven system senses the load and continuously adjusts hydraulic power to maximize your efficiency. Operators have precise control and the power needed for simultaneous lift, tilt and travel.

**Features of 953K-963K (continued):**

- **Position sensing cylinders.** Position sensing cylinders allow the operator to set lift and tilt kickouts to match the application without leaving the cab. Linkage position can be automatically set to specific positions for increased productivity. Advanced automatic features help make start/stop motions smoother, reducing vibration in the cab.
  - **Automatic kickouts.** Standard programmable automatic kickouts provide flexibility and productivity for precise load and dump target heights. Tilt and lift kickouts are easily set by positioning the bucket or attachment and pressing a button on the right-hand control panel in the cab.
  - **Implement and steering controls.** Electro-hydraulic implement controls provide the operator with responsive, smooth and precise control of bucket and lift arms.
    - Choose from either joystick or two-lever implement controls to match operator preference or application.
    - Speed/steering controls are available as either a joystick or as V-lever and foot pedals.
    - A variable throttle control dial lets you use preset engine speeds, customize engine speeds for operator preference.
    - Selectable electro-hydraulic maps and hydrostatic transmission allow you to set implement response — fine, normal, coarse — to match operator preference or application.
    - Hydrostatic drive system provides quick machine travel speed, on-the-go directional changes and counterrotation.
  - **Aftertreatment technologies.** With millions of working hours on tens of thousands of units since the Tier 4 Interim/Stage IIIB/Japan 2011 (Tier 4 Interim) product introductions, you can be confident in the quality and value of your Cat Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) investment. To meet the reduction in NO<sub>x</sub> emissions required by Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards, Caterpillar engineers added Selective Catalytic Reduction (SCR) to the already proven aftertreatment solution.
  - **Diesel Exhaust Fluid.** Selective Catalytic Reduction utilizes Diesel Exhaust Fluid (DEF), which can be conveniently refilled from ground level when you refuel. The system is designed to use one tank of DEF for each tank of fuel (1:1 DEF fill ratio). A gauge on the dash shows your fluid level. Across a variety of applications, the 963K typically has used DEF at a rate of 2.5-3 percent of fuel consumption. When the machine is turned off, a pump will automatically purge the DEF lines. A symbol on the dash and a light/symbol in the engine compartment indicate when the purge is complete and that it is safe to turn off the electrical disconnect. If the engine/aftertreatment temperatures are high, a Delayed Engine Shutdown will activate automatically to cool the machine and then purge the lines.
  - **Buckets.** A choice of buckets help you optimize your machine for the work you do. The General Purpose bucket is designed for excellent loadability and long life in applications like hard bank excavating, stripping and stockpile loading. The Multipurpose bucket is designed for versatility, and is ideal for a variety of tasks like loading, stripping, clearing, bulldozing, picking up debris and fine grading. The bucket clamps hydraulically to grip or handle other tough-to-grasp materials.
- A new optional Performance Series bucket contributes to your productivity by moving 5-10 percent more material per hour. And for special applications, Caterpillar also offers buckets optimized for applications like waste/landfill and ship hold work.

**Features of 953K-963K (continued):**

- **K Series™ bucket tooth tips.** The K Series tooth system stays sharp, holds tight and allows for simple changes. The lower-profile shape maintains optimal sharpness, penetration and digging ability throughout the tip life.
- **Quick coupler ready.** Fusion™ Quick Coupler option gives you more versatility by allowing easy use of forks, buckets, etc. from wheel loaders and other Fusion compatible machines.
- **Ripper.** The multi shank ripper adds extra versatility and force to expand the machine's range of applications. The ripper beam has three pockets for holding ripper shanks, and its design allows the machine to rip frozen ground, asphalt and even hard soils or rock. Long shanks deliver more work per pass making the machine more productive.
- **Safety.** New handles and steps help operators climb on and off the machine more easily, from the front or the back of the tracks.
  - Excellent visibility to the bucket and all around the machine helps operators work more confidently.
  - Rear vision camera is available to enhance visibility behind the machine.
  - New seat belt indicator gives an alarm and registers fault code through Product Link if the operator fails to buckle up, enhancing job site safety.
  - Improved ergonomics, a quieter engine and reduced effort controls help lessen fatigue so operators are better able to remain fresh and focused.
- **Serviceability.** The 963K is designed to help you take care of routine maintenance and get back to work.
  - Grouped service points are located behind large access doors, and daily grease points are in easy reach at ground level.
  - The tilt cab allows easy access to drive train and hydraulic systems.
  - The cooling system can be accessed from the engine compartment and features a fold-down fan for easy clean-out.
  - A handy bracket at the rear of the machine holds a shovel to help you clean the undercarriage.
  - The Diesel Particulate Filter in the Clean Emissions Module is designed to work for the life of the engine without needing to clean or replace the filter.
  - The service mode in the operator display shows you hydrostatic and implement pressure for easier troubleshooting and servicing.

**Special Arrangements of 953K and 963K:**

- **Waste Handler.** Designed and built from the frame up to take on the unique challenges of landfill and transfer station work.
  - Specialized guarding, striker bars and seals help protect the machine from impact and airborne debris.
  - Final drive guarding helps prevent wrapping and damage.
  - Cooling system is designed for high debris environments, with easy access for cleanout.
  - Specialized air handling features help deliver cleaner air to the machine and to the cab.
  - Landfill buckets and track options help you optimize your waste handler for the job.
- **Ship Hold/Port Handling.** Maneuverability, ease of operation and reach make a track loader the ideal machine for quickly removing materials from ship holds.
  - Sweep down walls and handle a wide variety of materials.
  - Specialized sealing, guards and bumpers help protect key components.
  - Added lighting packages help illuminate the work area.
  - Specialized implements, like coal buckets and trim blades, help you equip the machine for optimal performance.
  - Fusion Quick Coupler option gives you more versatility by allowing easy use of forks, buckets, etc. from wheel loaders and other Fusion compatible machines.
  - Lift eyes on the frame and undercarriage are widely spaced for stability during lifting.
- **Custom Products/Value Packages.** Caterpillar offers a variety of custom product options for track loaders, such as wide gauge machines and special guarding packages.

\*These values may vary slightly with different vehicle configurations.

**NOTES:** Usable pull will depend upon weight and traction of equipped tractor.  
 Assumes sufficient machine weight for <5% track slip at POR pressure.  
 Assumes pumps and motors are broken in.  
 Assumes nominal engine power and valve settings.  
 Drawbar pull at track stall will be lower.

## EXTREME SLOPE OPERATION

The maximum fore and aft grade in static condition on which each track loader will maintain proper lubrication is 45 degrees (100%). Consult Operation & Maintenance Manual (if applicable) for POWER TRAIN fluid level overfill requirements for operation on extreme slopes. Extreme slope operation is anytime the slope exceeds 25° (47%).

When working sidehills and slopes, consideration should be given to the following important points:

- Speed of travel — At higher speeds, inertia forces tend to make the track loader less stable.
- Roughness of terrain or surface — Ample allowance should be made where the terrain or surface is uneven.
- Mounted equipment — Buckets, rippers, winches, and other mounted equipment cause the track loader to balance differently.
- Nature of surface — New earthen fills may give way with the weight of the track loader. Rocky surfaces may promote side slipping of track loader.

The ENGINE should never be overfilled with oil. This may lead to rapid overheating. For extreme slope operation, engine oil should be maintained at the full mark.

**NOTE:** Both ENGINE and POWER TRAIN fluid levels should be checked on level ground before working sidehills and slopes.

- Track slippage due to excessive loads — This may cause downhill track to “dig in,” increasing angle of track loader.
- Width of shoes — Wide track shoes tend to decrease “digging in,” hence track loader is more stable.
- Operated equipment — Be aware of the stability and other performance features of the equipment operated by the track loader.
- Keep all attachments or pulled loads low to the ground for optimum stability.

**NOTE:** Safe operation on steep slopes may require special machine maintenance as well as excellent operator skill and proper equipment for the specific application. Consult Operation & Maintenance Manual (if applicable) for proper fluid level requirements.

**SAE BUCKET RATING****SAE Bucket Capacities**

*Struck capacity* is that volume contained in a bucket after a load is leveled by drawing a straight edge resting on the cutting edge and the back of the bucket.

*Heaped capacity* is a struck capacity *plus* that additional material that would heap on the struck load at a 2:1 angle of repose with the struck line parallel to the ground.

SAE J742 (Oct. 79) specifies that the addition of any auxiliary spill guard to protect against spillage of material which might injure the operator will not be included in bucket capacity ratings. Buckets with irregular shaped cutting edges (vee edge) the strike plane should be drawn at one-third the distance of the protruding portion of the cutting edge. Cat rock buckets are built with integral see-through rock guards. Cat light material buckets come standard with bolt-on edges. These features which add to actual bucket capacity are included in published ratings.

**Dump Height**

SAE J732 JUN92 specifies that dump height is the vertical distance from the ground to the lowest point of the cutting edge with the bucket hinge pin at maximum height and the bucket at a 45° dump angle. Dump angle is the angle in degrees that the longest flat section of the inside bottom of the bucket will rotate below horizontal.

**Static Tipping Load**

The minimum weight at center of gravity of “SAE Rated” load in bucket which will rotate rear of machine to a point where, on track loaders, front rollers are clear of the track under the following conditions:

- Loader on hard level surface and stationary.
- Unit at standard operating weight.
- Bucket at maximum rollback position.

- Load at maximum forward position during raising cycle.
- Unit with standard equipment as described in specifications unless otherwise noted under the heading.

**Operating Load**

In order to comply with SAE standard J818 MAY87, the operating load for track loaders should not exceed 35% of the Static Tipping load rating. See “Performance Data” of each machine in this handbook for increases to static tipping load by adding cab, counterweights, ripper-scarifier, etc.

**SELECTING A MACHINE****Steps in selecting the proper size loader:**

- Determine production required or desired.
- Determine loader cycle time and cycles per hour. A machine size must be assumed to select a basic cycle time.
- Determine required payload per cycle in loose cubic yards and pounds (meters and kilograms).
- Determine bucket size needed.
- Make machine selection using bucket size and payload as criteria to meet production requirements.
- Compare the loader cycle time used in calculations to the cycle time of the machine selected. If there is a difference, rework the process beginning at step 2.

**1. Production Required**

The production required of a track loader should be slightly greater than the production capability of the other critical units in the earth or material moving system. For example, if a hopper can handle 300 tons per hour, a loader capable of slightly more than 300 tons should be used. Required production should be carefully calculated so the proper machine and bucket selections are made.

**2. Loader Cycle Times**

Material type, pile height, and other factors may improve or reduce production, and should be added to or subtracted from the basic cycle time when applicable.

When hauls are involved, obtain haul and return portions of the cycle from the estimated travel chart (this section). Add the haul and return times to the estimated basic cycle time to obtain total cycle time.

**CYCLE TIME FACTORS**

A basic cycle time (Load, Dump, Maneuver) of 0.25-0.35 minutes is average for a track loader [the basic cycle for large track loaders, 2 m<sup>3</sup> (2.6 yd<sup>3</sup>) and up, can be slightly longer], but variations can be authenticated in the field. The following values for many variable elements are based on normal operations. Adding or subtracting any of the variable times will give the total basic cycle time.

**Estimating Cycle Time**

Cycle time of a track loader needs to be determined to find loads per hour. Total cycle time includes the following segments:

Load Time + Maneuver Time + Travel Time + Dump Time

**Load Time —**

Material	Minutes
Uniform aggregates	0.03-0.05
Moist mixed aggregates	0.03-0.06
Moist loam	0.03-0.07
Soil, boulders, roots	0.04-0.20
Cemented materials	0.05-0.20

**Maneuver Time** — includes basic travel, four changes of direction and turning time, and will be about 0.20 minutes with a competent operator.

**Travel Time** — in a load and carry operation is comprised of haul and return times which can be determined by the travel charts in this section.

**Dump Time** — is dictated by the size and strength of the dump target and varies from 0.00 to 0.10 minutes. Typical dump times into highway trucks are from 0.04 to 0.07 minutes.

**NOTE:** When comparing hydrostatic track loaders with former power shift models (using the production estimating method) two factors must be considered: (1) The hydrostatic track loaders on the average outcycle power shift models by up to 10 percent due to faster machine speed and easier operation. (2) Larger, rear engine hydrostatic track loaders incorporate Z-bar linkage, which provides substantially better bucket fill factors. The degree to which each factor affects estimated production should be left to the user's judgment depending on the particular job application and conditions.

Example: Moist loam is being excavated from a bank and loaded into trucks.

	Minutes
Load — moist loam	0.05
Maneuver Time	0.20
Travel — none required	0.00
Dump	0.05
Total Cycle	0.30 min. or 200 cycles per 60 min. hour

*Minutes added (+)  
or Subtracted (-)  
From Basic Cycle*

**Materials**

- Mixed . . . . . +0.02
- Up to 3 mm (1/8 in) . . . . . +0.02
- 3 mm (1/8 in) to  
20 mm (3/4 in) . . . . . -0.02
- 20 mm (3/4 in) to  
150 mm (6 in) . . . . . 0.00
- 150 mm (6 in) and over . . . . . +0.03 and Up
- Bank or broken . . . . . +0.04 and Up

**Pile**

- Conveyor or Dozer piled  
3 m (10 ft) and up . . . . . 0.00
- Conveyor or Dozer piled  
3 m (10 ft) or less . . . . . +0.01
- Dumped by truck . . . . . +0.02

**Miscellaneous**

- Common ownership of  
trucks and loaders . . . . . Up to -0.04
- Independently owned trucks . . . . . Up to +0.04
- Constant operation . . . . . Up to -0.04
- Inconsistent operation . . . . . Up to +0.04
- Small target . . . . . Up to +0.04
- Fragile target . . . . . Up to +0.05

Using actual job conditions and the above factors, total cycle time can be estimated. Convert total cycle time to cycles per hour.

$$\text{Cycles per hour at 100\% Efficiency} = \frac{60 \text{ Min}}{\text{Total Cycle Time in Minutes}}$$

Job efficiency is an important factor in machine selection. Efficiency is the actual number of minutes worked during an hour. Job efficiency accounts for operator breaks, and other work interruptions. See "Efficiency Considerations" in this section.

- Bucket Fill Factors
  - Recommended Operating Capacities
- ## Loader Production

### Bucket Fill Factors

The following indicates the approximate amounts of material as a percent of rated bucket capacity which will actually be delivered per bucket per cycle. This is known as “Bucket Fill Factor.”

Loose Material	Fill Factor
Mixed Moist Aggregates	95-110%
Uniform Aggregates up to 3 mm (1/8 in)	95-110
3 mm-9 mm (1/8 in-3/8 in)	90-110
12 mm-20 mm (1/2 in-3/4 in)	90-110
24 mm and over (1 in)	90-110
<b>Blasted Rock</b>	
Well	80-95%
Average	75-90
Poor	60-75
<b>Other</b>	
Rock Dirt Mixtures	100-120%
Moist Loam	100-120
Soil, Boulders, Roots	80-100
Cemented Materials	85-100

Fill factors on track loaders are affected by bucket penetration, breakout force, rack back angle, bucket profile and ground engaging tools such as bucket teeth and segments or bolt-on replaceable cutting edges.

### GENERAL PURPOSE BUCKET W/TEETH & SEGMENTS MAXIMUM OPERATING CAPACITIES

MODEL	GENERAL PURPOSE BUCKET SIZE		MAXIMUM OPERATING CAPACITY	
	m <sup>3</sup>	yd <sup>3</sup>	kg	lb
953D/953K	1.85	2.4	3182	7015
963D/963K	2.45	3.2	4214	9290
973D	3.21	4.2	5521	12,174

### LOADER PRODUCTION

Loader production equals quantity of material the bucket carries per load × number of bucket loads per hour.

#### Estimating Bucket Load

The quantity of material in a loader bucket is estimated by two methods, depending on whether the material being loaded is in a loose or bank state.

1. When the material is loose, as in stockpile loading, the bucket load is estimated in loose meters (or cubic yards) by a Bucket Fill Factor (see Tables Section or chart following this discussion). The quantity of material is determined as follows:

$$\text{Rated Bucket Capacity} \times \text{Bucket Fill Factor} = \text{Bucket Payload in Loose m}^3 \text{ (yd}^3\text{)}$$

For example, a 973 with a 3.2 m<sup>3</sup> (4.2 yd<sup>3</sup>) General Purpose bucket loading moist loam material will carry:

$$3.2 \text{ m}^3 \times 1.15 = 3.68 \text{ loose cubic meters}$$

$$(4.2 \text{ yd}^3 \times 1.15 = 4.83 \text{ loose cubic yards})$$

Once the potential bucket load has been determined, check the static tipping load ratings on the specific machine to determine if bucket load is in fact a safe operating load. (*Safe operating load as defined by SAE for track loaders should not exceed 35% of static tipping load.*)

Productivity in many applications is measured in tons. See Tables Section for material densities if conversion to tons is desired.

2. When material is in the bank state, as in excavation, productivity is measured in bank meters (cubic yards). Bucket load in Bm<sup>3</sup> (BCY) is estimated by applying one of the load factors from the Tables section to convert the excavated material in the bucket from Bm<sup>3</sup> (BCY) to Lm<sup>3</sup> (LCY) to allow for the digging and carrying characteristics of the material. The quantity of excavated material a bucket carries is then determined as follows:

$$\text{Rated Bucket Capacity} \times \text{Load Factor} \times \text{Bucket Fill Factor} = \text{Bucket Payload in Bm}^3 \text{ (BCY)}$$

Example: a 953D with a 1.85 m<sup>3</sup> (2.4 yd<sup>3</sup>) General Purpose bucket loading wet loam earth from bank:

$$1.85 \text{ m}^3 \times 0.79 \times 1.15 = 1.68 \text{ Bm}^3$$

$$(2.4 \text{ yd}^3 \times 0.79 \times 1.15 = 2.18 \text{ BCY})$$

### Estimating Production

Machine and job considerations include:

- Machine model and bucket size
- Material type, particle size, density and load factor (see Tables Section)
- Bucket fill factor
- Haul distance
- Underfoot conditions
- Altitude
- Dump target size, height, and type

*Example:*

**Conditions —**

Machine	953D
Bucket size	1.85 m <sup>3</sup> (2.4 yd <sup>3</sup> )
Material	Moist Loam
Bucket fill factor	1.15
Haul length	30 m (100 ft)
Dump target	Pile
Travel in forward speed	

**Cycle Time**

	<b>Minutes</b>
Load time	0.15
Maneuver time	0.20
Travel time (from curves)	0.40
Dump time	<u>0.05</u>
Total	0.80

**Loads Per Hour —**

$$\frac{60 \text{ min/hr}}{0.80 \text{ min/cycle}} = 75 \text{ cycles per hour @ } 100\% \text{ efficiency}$$

**Load Per Cycle —**

$$\begin{aligned}
 1.85 \text{ m}^3 \times 1.15 \text{ BFF} &= 2.13 \text{ Lm}^3 \times 0.81 \text{ LF} \\
 &= 1.72 \text{ Bm}^3 \\
 (2.4 \text{ yd}^3 \times 1.15 \text{ BFF} &= 2.76 \text{ LCY} \times 0.81 \text{ LF} \\
 &= 2.24 \text{ BCY})
 \end{aligned}$$

**Hourly Production —**

$$\begin{aligned}
 1.72 \text{ Bm}^3 \times 75 \text{ cycles/h} &= 129 \text{ Bm}^3/\text{h} \\
 (2.24 \text{ BCY} \times 75 \text{ cycles/hr} &= 168 \text{ BCY/hr})
 \end{aligned}$$

More accurate production estimates can be made by recording actual machine cycle times in the same or similar application. Then visually verify the approximate bucket fill factor.

### Efficiency Considerations

Loader capacity should always be matched to peak production requirements of the job. Actual “on-the-job” loader productivity will be influenced by factors such as operator skill, personal delays, job layout and other delays. Experience and knowledge of local conditions will be the best indicators of actual job efficiency.

Operation	Working Hour	Efficiency Factor
Day	50 min/Hr	0.83

### An Alternative Machine Selection Method

Another method of selecting the right Track Loader and bucket to meet production requirements is by use of the nomographs on the following pages. The method is quicker and easier than the preceding example because it does not require as many calculations, yet the accuracy is about the same within the normal limits of input data.

Be careful when entering and reading data from the nomographs because some scales increase from bottom to top, while others are the reverse. Do not be overly concerned with the precision as affected by pencil line width or reading to the hundredth of a m<sup>3</sup> (yd<sup>3</sup>). Remember that bucket fill factor, material density, and cycle time are at best close estimates.

*Example problem*

A track loader must produce 200 Lm<sup>3</sup> (262 LCY) per hour. Estimated cycle time is 0.5 minutes, working 50 minutes per hour. Bucket fill factor is 110% and the material density is 1600 kg/Lm<sup>3</sup> (2700 lb/LCY).

Determine bucket size, machine model and hourly production in tons and yards.

### Solution

At full efficiency, it will cycle 120 times per hour. Since only an average 50 minutes are available, only 100 cycles will be completed per hour.

Starting on Scale A at 100 cycles per hour draw a straight line intersecting 200 m<sup>3</sup>/hr (262 yd<sup>3</sup>/hr) on Scale B and continuing the line on to Scale C giving 2.0 m<sup>3</sup> (2.62 yd<sup>3</sup>) required payload.

Follow steps 1 through 7 on the next two pages.

# Track Loaders

## Production and Machine Selection Nomograph

- To find required bucket payload and bucket size

- 1) Enter Scale A cycles per hour (100) and B hourly production 200 m<sup>3</sup>/hr (262 yd<sup>3</sup>/hr).
- 2) Connect A and B and extend to C to find required payload 2.0 m<sup>3</sup> (2.62 yd<sup>3</sup>).
- 3) Connect C to bucket fill factor on Scale D (110%) and extend to E to find required bucket size 1.8 m<sup>3</sup> (2.35 yd<sup>3</sup>).
- 4) Transfer Scale A and C readings to nomograph on following page.

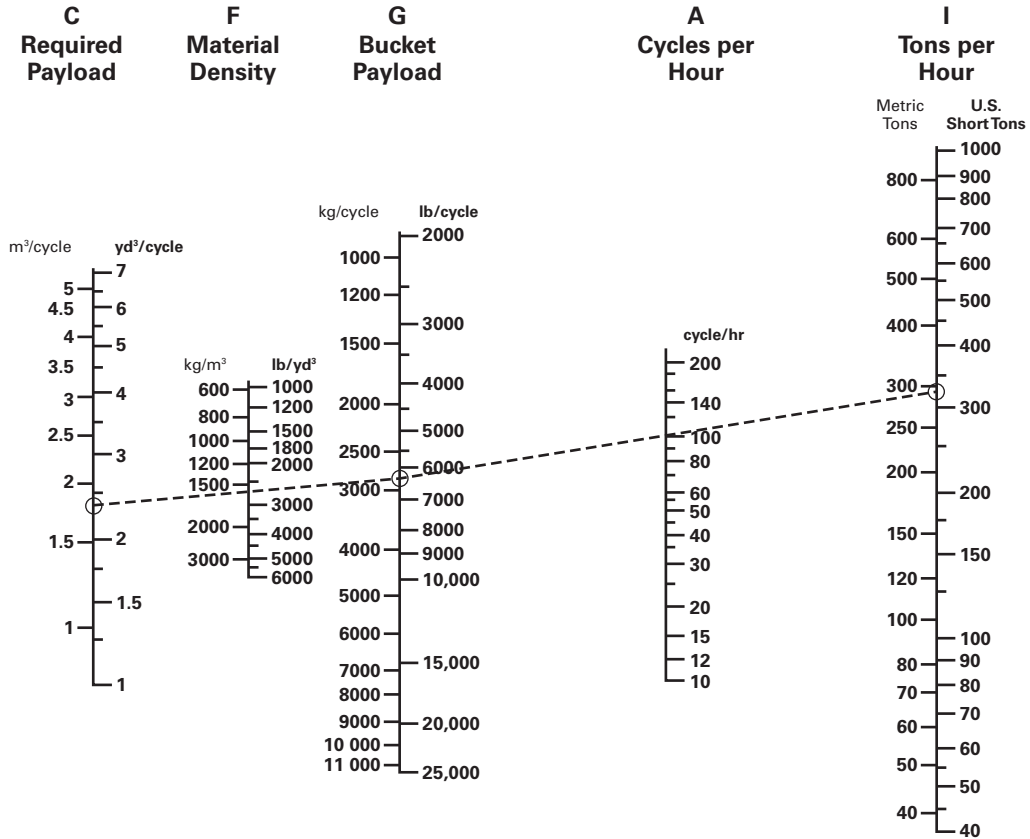

# Production and Machine Selection Nomograph

# Track Loaders

- To find payload weight for stability and output in tons per hour

- 5) Connect C 1.8 m<sup>3</sup> (2.35 yd<sup>3</sup>) to F 1600 kg/m<sup>3</sup> (2700 lb/yd<sup>3</sup>) and extend to G to find payload weight 2880 kg (6345 lb).
- 6) Compare G bucket payload weight 2880 kg (6345 lb) with maximum operating capacities table in this section to see if the 1.85 m<sup>3</sup> (2.4 yd<sup>3</sup>) bucket can handle the desired payload. Table indicates the 953D with a

- 1.85 m<sup>3</sup> (2.4 yd<sup>3</sup>) bucket equipped with bolt-on cutting edge or teeth and segments has a greater operating capacity of 3343 kg (7370 lb), therefore stability is okay.
- 7) Extend Scale G reading 2880 kg (6345 lb) through Scale A (100) to Scale I to find tons per hour 288 metric ton/hr (317 U.S. ton/hr).

963D/963K

973D

TRAVEL TIME CHARTS

Conditions:

- No grades.
- Speeds loaded and empty essentially the same.
- Bucket position constant during travel.
- Travel encountered in maneuver portion of cycle not included.
- Acceleration time accounted for in maneuver time.

Travel Time (in minutes) =

$$Metric - \frac{\text{number of meters traveled}}{\text{speed (in km/h)} \times 16.67}$$

$$English - \frac{\text{number of feet traveled}}{\text{speed (in mph)} \times 88}$$

KEY

953D/953K — Hydrostatic top speed both forward and reverse 10 km/h (6.2 mph)

963D/963K — Hydrostatic top speed both forward and reverse 10 km/h (6.2 mph)

973D — Hydrostatic top speed both forward and reverse 11 km/h (6.83 mph)

### New Fusion Coupler System for 953K, 963D and 963K Track Loaders

The proven Fusion Coupler System is available for 953K, 963D and 963K machines. Key durability benefits experienced with the wheel loader platform are now available for the 953K, 963D and 963K Track Loader.

The biggest gain for the track loader user is durability; the Fusion coupler endures like no other. Patented dual wedge locks pull the tool tight to the coupler and hold it there for a solid, rattle-free fit. No rattle means no wear, so tools last longer. The wedge lock is built to stay tight even after thousands of tool changes. This coupler is built to be as tough as the linkage itself, for trouble-free performance day in and day out.

The 953K, 963D and 963K Fusion Coupler is supported by a set of tools:

**General Purpose Buckets** provide good all-around performance for stockpiling, re-handling, excavating and bank loading. A wide bucket is available for use with a machine that has wide gauge tracks.

**Multi-Purpose Buckets** have a unique four-way action that can load, strip top soil, bulldoze, clamp pipe or large chunks of concrete, clean up debris and many other tasks.

**Pallet Forks** are an essential tool on construction job sites. Cat Fusion Pallet Forks can be configured to allow the tines to either swing or stay in a fixed position.

### Fusion Interchangeability

The Fusion Coupler for the 953K, 963D and 963K is compatible with most of the Fusion tools for wheel loaders, allowing interchangeability. However, common sense must be used as machine power envelopes and use profiles are very different for each machine platform.

Care must be taken to get the best performance while taking advantage of tool interchangeability. While all Fusion couplers can pick up any Fusion tool, some tools are less useful when used on a different type of carrier than their design intent.

For compatibility questions, contact Cat Work Tools.

## SHOE OPTIONS

① **Double Grouser Shoes**

- **Extreme service shoes** are available which have more hardened wear material for longer wear life and higher impact applications.

② **Trapezoidal Center Hole Shoes**

③ **Single Grouser Shoes**

- **Wider shoes** are also available to reduce ground pressure in soft underfoot conditions.

④ **Chopper Shoes**

Other shoe options are available. Consult a Cat dealer for more information.

## SYSTEMONE SHOES

**Double Grouser Shoes**

- Work best in applications that require less penetration and traction.
- Recommended for applications that require better turning capability and less ground disturbance.
- Feature two or three short grousers instead of one tall grouser.

**Center Hole Shoes**

- Work best in applications where packing causes the track to tighten. They are recommended for applications with large amounts of debris what tend to pack in the track.
- Reduces extricable packing between the shoe and the bushing since they allow the sprocket to punch out dirt and debris.

#### TRACK-TYPE TRACTORS

##### Features:

- **Cat® Diesel Engines** provide the power, high torque rise, reliability and performance you can depend on.
- **HEUI™** on D6R and D7R increases fuel efficiency, reduces smoke, improves cold starting and enhances diagnostic capabilities.
- **Mechanical Electronic Unit Injector (MEUI™)** on D8T, D9T, D10T2 and D11T excels in its ability to control injection pressure over the entire engine operating speed range. It combines the technical advancement of an electronic control system with the simplicity of direct mechanically controlled unit fuel injection. These features allow the engine to have complete control over injection timing, duration, and pressure.
- **Common Rail fuel injection system** on D3K2, D4K2, D5K2, D6K2, D5R2, D6N, D6T and D7E machines; optimizes performance and fuel consumption, minimizes heat rejection, and lowers emissions.

- **Oil cooled steering clutches and brakes** standard on D9R, D10T2 and D11T.
- **Finger Tip Controls (FTC)** of transmission, steering clutches and brakes on D10T2 and D11T.
- **Differential steering** allows infinitely variable turning radius. Standard on the D5R2, D6N, D6R2, D6T, D7R, D7E, D8R, D8T and D9T, allows the tractor to make a “power turn” keeping both tracks working for more traction and higher performance.
- **Electronic Hydrostatic Power Train System** on D3K2 through D6K2 allows power turns, stepless speed range, smooth modulation, dynamic hydrostatic braking, superior maneuverability and excellent controllability.
- **Electric Drive Power Train System** on D7E allows stepless speed range, smooth modulation, and excellent efficiency. When coupled with differential steer it provides superior maneuverability with locked-track pivot turn capability and excellent controllability.
- **Combined hand lever steering** located left of operator provides easier operation on D9R.
- **Standard Tractors** designed for heavy dozing and general grading.
- **XL Tractor D6T** offers higher horsepower and longer roller frames for increased finish grading capability, flotation and productivity.
- **Extra Wide (XW) gauge** on D6T length roller frame provides wider shoes for greater flotation and stability for steep slope grading.
- **Sealed and Lubricated Track** reduces pin and bushing wear for lower undercarriage repair costs. Sealed and lubricated track is standard on the D3K2, D4K2, and D5K2 while heavy duty track chain is available on D5R, D6K2, D6N, D6T, and D7E improves wear life and reduces pin/bore stretching and cracking.
- **SystemOne™ Undercarriage** extends undercarriage system life, improves reliability, and reduces owning and operating costs. Optional on D6T (all sources), D5R2, D6K2, D6N, D6R2, optional on D8T and D8R (all sources), D3K2, D4K2, D5K2.
- **Elevated sprockets** (not on D6K2 or D7E) eliminate final drive stress induced by roller frame movement and ground impact loads. Final drives pull chain only. Seals moved up out of dirt, sand and water for longer life. Blade visibility improved because operator sits higher.
- **Resilient mounted bogie undercarriage** on D8R, D8T, D9T, D10T2 and D11T reduces shock transmitted to tractor. Allows track to conform to rough ground for better traction.
- **Solid mounted undercarriage** standard on D3K2 through D5K2 provides stable platform for low impact, and high abrasion applications. Provides optimum finish grading performance.
- **Oscillating undercarriage** on D6K2 through D7E and optional on the D8R and D8T decreases ground shock to the machine and provides a smoother, more comfortable ride for the operator.
- **Accessible modular design** on D6N XL and up greatly reduces drive train removal and installation time resulting in reduced repair costs.
- **Tag link** on D7R, D8R/D8T and up; L-shaped push arms on D6N, D6T and D7E. Both designs allow closer mounting of dozer blades. This reduces total tractor length, improves maneuverability, balance, blade penetration and pryout.
- **Low ground pressure (LGP)** tractors offer greater flotation in soft, swampy conditions. Available on D3K2 through D8T.

### Cat D7E — Resourceful in every way

- The D7E is designed to maximize efficiency and productivity while conserving natural resources.
- Burns 10–30% less fuel per hour than previous models. Less fuel burned means reduced emissions.
- The D7E earned a 2009 Clean Air Excellence Award from the U.S. Environmental Protection Agency.
- More efficient – 25% more material moved per liter/gallon of fuel.
- Fewer parts and longer component life, less fuel and fluids, means less to replace and less to dispose.
- Major structures and components are built to be rebuilt, reducing waste and replacement costs.

<sup>1</sup> Operating weight includes ROPS/FOPS cab, operator, lubricants, coolant, full fuel tank, standard track, hydraulic controls and fluid, SU blade and ripper. LGP operating weight includes drawbar instead of ripper.

<sup>2</sup> Dimensions measured from ground line. Add grouser height for total dimension on hard surfaces.

<sup>3</sup> Height (Stripped Top) — without ROPS canopy, exhaust, seat back or other easily removed encumbrances.

<sup>4</sup> Includes drawbar.

## Track-Type Tractor Sustainability

Cat engines with ACERT Technology provide powerful reliability, while meeting the stringent emissions standards.

<sup>1</sup> Product available to meet Tier 2/Stage II/Japan 2001 (Tier 2) equivalent OR Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards.

<sup>2</sup> Operating weight includes coolant, lubricants, full fuel tank, ROPS, FOPS cab, SU ABR bulldozer (D10T2) or U ABR bulldozer (D11T), dual tilt, single-shank ripper with pin-puller, fast fuel, standard ES shoes, and operator.

D11T CD has 11 Carrydozer and single-shank Carrydozer ripper.

<sup>3</sup> Height (Stripped Top) — without ROPS canopy, cab, exhaust, lift cylinders, seat back or other easily removed encumbrances.

<sup>4</sup> Overall length of D11T CD includes Straight (CarryDozer) Blade and SS Ripper.

<sup>5</sup> Overall length of machine from front tag link trunnion to rigid drawbar and excludes track grouser height.

<sup>6</sup> Per ISO 6746 — Must add grouser height for total dimension on hard surfaces.

All dimensions are approximate.

**D3K2 XL  
D3K2 LGP**

**NOTES:** Usable pull will depend upon weight and traction of equipped tractor.

Assumes sufficient machine weight for <5% track slip at POR pressure.

Assumes pumps and motors are broken in.

Assumes nominal engine power and valve settings.

Drawbar pull at track stall will be lower.

**D4K2 XL  
D4K2 LGP**

**D5K2 XL

## EXTREME SLOPE OPERATION

The maximum fore and aft grade in static condition on which each track-type tractor or pipelayer will maintain proper lubrication is 45 degrees (100%). Consult Operation & Maintenance Manual (if applicable) for POWER TRAIN fluid level overfill requirements for operation on extreme slopes. Extreme slope operation is anytime the slope exceeds 25° (47%).

When working sidehills and slopes, consideration should be given to the following important points:

- Speed of travel — At higher speeds, inertia forces tend to make the tractor less stable.
- Roughness of terrain or surface — Ample allowance should be made where the terrain or surface is uneven.
- Mounted equipment — Bulldozers, sidebooms, winches, and other mounted equipment cause the tractor to balance differently.
- Nature of surface — New earthen fills may give way with the weight of the tractor. Rocky surfaces may promote side slipping of tractor.
- Track slippage due to excessive loads — This may cause downhill track to “dig in,” increasing angle of tractor.

The ENGINE should never be overfilled with oil. This may lead to rapid overheating. For extreme slope operation, engine oil should be maintained at the full mark.

**NOTE:** Both ENGINE and POWER TRAIN fluid levels should be checked on level ground before working sidehills and slopes.

- Implements hitched to the drawbar — This may decrease weight on uphill track, e.g., logging arch, two-wheel wagon.
- Height of hitch on tractor — When a high drawbar is used the tractor is less stable than with the standard drawbar.
- Width of shoes — Wide track shoes tend to decrease “digging in”, hence tractor is more stable.
- Operated equipment — Be aware of the stability and other performance features of the equipment operated by the tractor.
- Keep all attachments or pulled loads low to the ground for optimum stability.

**NOTE:** Safe operation on steep slopes may require special machine maintenance as well as excellent operator skill and proper equipment for the specific application. Consult Operation & Maintenance Manual (if applicable) for proper fluid level requirements.

# HYDRAULIC CONTROLS

## CONTENTS

Features .....19-29  
 Specifications .....19-30

### Features:

- **Designed and built for specific tractor applications.** Valves and components sized for exacting quality and performance.
- **Job requirements matched** through various arrangements.
- **Hydraulic blade and ripper controls:** Mechanical controls on G Series. Electro hydraulic controls on D6N and D6K2. Pilot blade and ripper controls on D6T Tier 3/Stage IIIA, Japan 2006 (Tier 3) equivalent with optional electro hydraulic blade control. Electro hydraulic blade and ripper controls on D6T Tier 4 Interim/Stage IIIB/Japan 2011 (Tier 4 Interim) equivalent Mechanical controls on D9R. Electro hydraulic blade and ripper controls on D7E, D8T, D9T, D10T2, and D11T.
- **Full flow filters\***... all oil completely filtered.
- **Dual tilt** — standard on D11T and D11T CD, attachment option on D7E, D8R, D8T, D9R, D9T, D10T2.

\*Exception — D8R 2-pump.

## Features:

- **Straight Bulldozers** — adjustable tilt angle controls blade penetration.
- **Variable cutting edge Power Angle and Tilt (VPAT)** — blade is available on the D3K2, D4K2, D5K2, D6K2, D6N, and D6T. The blade can be mechanically tipped forward for improved penetration or back for more productivity and easier finish grading.
- **Angling Bulldozers** — 25° right/left angling; C-frame allows mounting other tools.
- **Universal Bulldozers** — 25° wings provide increased capacity, less spillage.
- **Semi-Universal Bulldozers** — combines penetration ability of straight blade with increased load capacity provided by short 25° wings.
- **Wheel Dozer blades** are offered in straight and universal blade design with hydraulic pitch and tilt control.
- **Box-section construction** on blades adds rigidity and strength.
- **Cutting edges** are heat treated and reversible for extra life.

**NOTE:** This chart suggests a range of blade options for Caterpillar built machines. It is not totally inclusive of all blades available.

**BLADE SELECTION**

Properly matching tractor and dozer is a basic requirement for maximizing production. First consider the kind of work the tractor will be doing most of its life. Then evaluate:

- Material to be moved.
- Tractor limitations.

**Materials to be moved**

Most materials are dozeable. However, dozer performance will vary with material characteristics such as:

*Particle Size and Shape* — The larger the individual particle size, the harder it is for a cutting edge to penetrate. Particles with sharp edges resist the natural rolling action of a dozer blade. These particles require more horsepower to move than a similar volume of material with rounded edges.

*Voids* — Few voids or the absence of voids means the individual particles have most or all of their surface area in contact with other particles. This forms a bond which must be broken. A well graded material, which lacks voids, is generally heavy, and will be hard to remove from the bank state.

*Water Content* — In most materials the lack of moisture increases the bond between particles and makes the material difficult to remove from the bank state. A high moisture content makes dozing difficult because the material is heavy and requires more force to move. Optimum moisture reduces dust and offers the best condition for dozing ease and operator comfort.

The effect of freezing depends on the moisture content. When frozen, the material's bond strengthens as moisture content increases and temperature decreases. However, freezing a completely dry material does not change its characteristics.

An indication of a blade's ability to penetrate and obtain a blade load is kW per meter (or horsepower per foot) of cutting edge. The higher the kW/meter (HP/foot), the more aggressive the blade. Kilowatt per  $\text{Lm}^3$  (horsepower per loose cubic yard) indicates a blade's ability to push material. The higher the kW/ $\text{Lm}^3$  (HP/LCY), the greater the blade's potential capability for carrying material at a greater speed.

**Tractor Limitations**

The weight and horsepower of the machine determines its ability to push. No tractor can exert more pounds push than the machine itself weighs and its power train can develop. Various terrain and underfoot conditions on the job limit the tractor's ability to use its weight and horsepower. The "approximate coefficient of traction factors" chart in the Tables Section presents these traction factors for common materials. To use the chart, take the total tractor weight (with attachments) times the factor to arrive at the maximum usable push the dozer can exert.

**Production Dozing Tools**

**"U"** — Universal blade — the large wings on this blade include one end bit and at least one section of cutting edge which make it efficient for moving big loads over long distances as in land reclamation, stockpile work, charging hoppers and trapping for loaders.

As this blade has a lower kW/meter (HP/foot) of cutting edge than an "S" or "SU", penetration should not be a prime objective. With a lower kW/ $\text{Lm}^3$  (HP/LCY) than an "S" or "SU", this blade is best for lighter or relatively easily dozed material. If equipped with tilt cylinders the U blade can be used to pry out, level, cut ditches and steer the tractor.

**"SU"** — The Semi-U blade combines the desirable characteristics of S and U-blades into one package. It has increased capacity by the addition of short wings which include only the dozer end bits. The

wings provide improved load retention capabilities while maintaining the blade's ability to penetrate and load quickly in tightly packed materials and to handle a wide variety of materials in production oriented applications. Tilt cylinder(s) increase both the productivity and versatility of this dozer. Equipped with a push plate, it is effectively used for push loading scrapers.

## Blade Selection

- General Purpose Dozing Tools
- Special Application Dozing Tools

**“CD”** — The CD or Carry-Dozer Blade is available for the D11T CarryDozer only. It is built to the same high standard of structural integrity as the “U” and “SU” Dozers. The CD Blade has

a unique “bucket” shape that allows it to carry several cubic yards or cubic meters of material in the blade. This acts as a disposable counterweight that allows the CarryDozer to push more material per pass than a standard D11T. The CarryDozer will not be as effective as the “U” or “SU” dozer in tightly packed or poorly shot material. It is also more sensitive to the carry-back in sticky materials.

### General Purpose Dozing Tools

**“S”** — The Straight blade provides excellent versatility. Since it is physically smaller than the SU or U-blade, it is easier to maneuver and can handle a wider range of materials. It has a higher kW/ meter (HP/foot)

of cutting edge than the SU or U-blade; consequently, the “S” is more aggressive in penetrating and obtaining a blade load. A tilt cylinder increases both the productivity and versatility of this dozer. With a high kW/Lm<sup>3</sup> (HP/LCY), the S-blade can handle heavy material easily.

**Power Angle and Tilt Blade** — Versatility is its key feature with its ability to perform a variety of site development to general dozing work as well as heavy-duty applications.

Angle and tilt control is with 2 levers on some machines, 1 lever on others.

Variable Power Angle and Tilt (VPAT) blade can be mechanically tipped forward for improved penetration or shedding sticky material and backward for finish grading and improved productivity.

### Special Application Dozing Tools

Caterpillar provides specialty bulldozers for specific applications. The blades are designed to increase production while performing certain tasks. Following are the most popular special applications blades.

### Variable Radius (VR) Blades

**Variable Radius Semi-U Blades** are excellent tools for land improvement, soil conservation, site development or general construction. They combine the

penetration ability of a Semi-U Blade with the load retention and high capacity of a U-blade.

They provide the aggressive cutting action needed for digging, while having the material retention characteristics needed for moving high volumes over a distance. This is accomplished through a moldboard which varies in radius from the edge to the center. This creates a rolling action in the material being moved, pushing it to the center of the blade for better retention. The extended side wings, angled to thirty degrees, further increase the capacity over a standard blade.

### Angle Blade (A-Blade)

**“A”** — Or Angling blade can be positioned straight or angled 25 degrees to either side. It is designed for side-casting, pioneering roads,

backfilling, cutting ditches and other similar tasks. It can reduce the amount of maneuvering required to do these jobs. Its “C” frame can be used for attachments such as pushing, land clearing, or snow removal tools. A-blades are not recommended for rock or severe applications.

### Cushion Dozers

**Cushion Dozers** are designed to push-load wheel-tractor scrapers, or track-type tractors. The heavy-duty design includes reinforcement to transfer machine power without damaging the blade or the

tractor. Blade cylinders are pinned to the C-frame, and the blade height is such that the blade lift cylinders are isolated from damaging forces.

The taller blade allows pushing from a higher position, eliminating blade drag and increasing productivity. The blade curvature is matched to the curve of the Cat Push Block for maximum contact area, preventing the block from riding over the top of the blade. Extended side plates make it easier for operators to “catch” the stinger when repositioning for a new pass. The center of the blade is armored with T-1 plate steel for maximum service life. The narrow width of the cushion blade increases machine maneuverability in congested cuts and reduces the possibility of cutting tires associated with SU and U-blades.

When not push-loading, the dozer can be used for cut maintenance and other general dozing jobs.

**Coal U-Blades** are designed specifically to move large volumes of coal in coal piles, at powerplants and transshipment points. The wing angle of thirty degrees crowds material to the center of the

blade, maximizing capacity by minimizing side spill. The moldboard is much higher and wider than standard, specifically to match the material density and loading characteristics of coal. The curve of the moldboard rolls the material forward, enhancing the carrying capacity. With this design, coal-moving capacity can be as much as 200 percent greater than a standard U-blade.

**Landfill U-Blades** provide capacity increases of up to fifty percent over a straight blade. Landfill blades have the height and width to handle large volumes of low-density refuse, but are tough

enough to dig and bulldoze ground cover. Vision to the load is provided by areas of screen in the upper blade. Angled wings slice into natural bed earth for trenches or cover material, adding to the versatility in the landfill.

**Reclamation U-Blades** — are purpose-built for reclamation of mine spoil piles. The blade has a larger capacity than a standard U-blade.

The wing angle of 28 degrees provides a good balance between load retention and shearing action, keeping the optimal load in front of the blade, but cutting cleanly through the material when necessary.

The width of **Woodchip U-Blades** gives operators maximum control and greater confidence, even in steep chip piles. Deep curvature of the moldboard keeps material flowing to live dead chips and optimize production on

long pushes. Blade height and wings angled at thirty degrees combine for excellent material retention – giving better production with every pass. An operator visibility window in the top section is standard.

**Multi-Application/Rock and Root Rakes**

**Multi-Application/Rock and Root Rakes** are perfectly suited for heavy duty land clearing including removal of stumps, large rocks or large trees and for work in clay and other heavy soils.

Frames are constructed of high strength steel for longer life. Cast teeth, with replaceable tips, are designed for maximum ground penetration and resistance to shock loading when prying or pushing trees, stumps and rocks. Brush rack is standard and increases height and capacity by as much as 40%.

Rake is a direct replacement for existing blade, and utilizes existing push arms and C-frames.

- Tractor and Blade
- SAE Blade Capacity Definition

KEY

- A** Length (Blade Straight)  
Blade:
- B** Width (including standard end bits)
- C** Height
- D** Maximum Digging Depth
- E** Ground Clearance @ Full Lift
- F** Maximum Tilt (Manual)
- G** Maximum Pitch Adjustment
- H** Maximum Hydraulic Tilt
- J** Hydraulic Tilt (manual brace centered)
- K** Push Arm Trunnion Width (to Ball Centers)

Blade capacities on the following pages are as determined by SAE recommended practice J1265. Capacities are defined as:

$$V_s = 0.8 WH^2$$

$$V_u = ZH(W-Z) \tan X$$

Where:  $V_s$  = Capacity of straight or angling blade.

$V_u$  = Capacity of semi-U or full U-blade.

$W$  = Blade width exclusive of end bits.

$H$  = Effective blade height considering tapered top corners, etc.

$Z$  = Wing length measured parallel to blade width @ ground line of cutting edges.

$X$  = Wing angle.

\*\*\*Blade height with cutting edge at 53°.

All dimensions are approximate.

**BULLDOZER PRODUCTION OFF-THE-JOB**

You can estimate bulldozer production using the production curves that follow and the correction factors that are applicable. Use this formula:

$$\text{Production (Lm}^3\text{/hr)} = \frac{\text{Maximum production}}{\text{LCY/hr}} \times \frac{\text{Correction factors}}{\text{LCY/hr}}$$

The bulldozer production curves give maximum uncorrected production for universal, semi-universal, and straight blades and are based on the following conditions:

1. 100% efficiency (60 minute hour — level cycle).
2. Power shift machines with 0.05 min. fixed times.
3. Machine cuts for 15 m (50 feet), then drifts blade load to dump over a high wall. (Dump time — 0 sec.)
4. Soil density of 1370 kg/Lm<sup>3</sup> (2300 lb/LCY).
5. Coefficient of traction:\*
  - a. Track machines — 0.5 or better
  - b. Wheel machines — 0.4 or better
6. Hydraulic controlled blades used.
7. Dig 1F\*\*  
Carry 2F\*\*  
Return 2R\*\*

To obtain estimated production in bank cubic meters or bank cubic yards, appropriate load factor from the Tables section should be applied to the corrected production as calculated above.

$$\text{Production Bm}^3\text{/hr} = \frac{\text{Lm}^3\text{/hr}}{\text{(BCY/h)}} \times \frac{\text{LF}}{\text{LCY/h}} \times \text{LF}$$

\*Coefficient of traction assumed to be at least 0.4. While poor traction affects both track and wheel vehicles, causing them to take smaller blade loads, wheeled units are affected more severely and production falls much more rapidly. While no fixed rules can predict this production loss, a rough rule of thumb is that wheel dozer production falls off 4% for each one-hundredth decrease in coefficient of traction below 0.40. If, for example, coefficient of traction is 0.30, the difference is ten-hundredths (0.10), and production is 60% (10 × 4% = 40% decrease).

\*\*This gear sequence is based on level to downhill terrain, light to medium density material, and no blade extensions such as spill plates, rock guards, etc. Exceeding these conditions may require carry in 1F, but productivity should equal or exceed “standard conditions” due to the larger loads that can be carried in 1F.

**JOB CONDITION CORRECTION FACTORS**

	TRACK-TYPE TRACTOR
<b>OPERATOR —</b>	
Excellent	1.00
Average	0.75
Poor	0.60
<b>MATERIAL —</b>	
Loose stockpile	1.20
Hard to cut; frozen —	
with tilt cylinder	0.80
without tilt cylinder	0.70
Hard to drift; “dead” (dry, non-cohesive material) or very sticky material	0.80
Rock, ripped or blasted	0.60-0.80
<b>SLOT DOZING</b>	
	1.20
<b>SIDE BY SIDE DOZING</b>	
	1.15-1.25
<b>VISIBILITY —</b>	
Dust, rain, snow, fog or darkness	0.80
<b>JOB EFFICIENCY —</b>	
50 min/hr	0.83
40 min/hr	0.67
<b>BULLDOZER*</b>	
Adjust based on SAE capacity relative to the base blade used in the Estimated Dozing Production graphs.	
<b>GRADES —</b> See following graph.	

\*NOTE: Angling blades and cushion blades are not considered production dozing tools. Depending on job conditions, the A-blade and C-blade will average 50-75% of straight blade production.

**% Grade vs. Dozing Factor**

(-) Downhill  
 (+) Uphill

**ESTIMATING DOZER PRODUCTION OFF-THE-JOB**

*Example problem:*

Determine average hourly production of a D8T/8SU (with tilt cylinder) moving hard-packed clay an average distance of 45 m (150 feet) down a 15% grade, using a slot dozing technique.

Estimated material weight is 1600 kg/Lm<sup>3</sup> (2650 lb/LCY). Operator is average. Job efficiency is estimated at 50 min/hr.

Uncorrected Maximum Production — 458 Lm<sup>3</sup>/h (600 LCY/hr) (example only)

Applicable Correction Factors:

- Hard-packed clay is “hard to cut” material . . . -0.80
- Grade correction (from graph) . . . . . -1.30
- Slot dozing . . . . . -1.20
- Average operator . . . . . -0.75
- Job efficiency (50 min/hr) . . . . . -0.83
- Weight correction. . . . . (2300/2650) -0.87

$$\begin{aligned}
 \text{Production} &= \text{Maximum Production} \times \text{Correction Factors} \\
 &= (600 \text{ LCY/hr}) (0.80) (1.30) (1.20) (0.75) \\
 &\quad (0.83) (0.87) \\
 &= 405.5 \text{ LCY/hr}
 \end{aligned}$$

To obtain production in metric units, the same procedure is used substituting maximum uncorrected production in Lm<sup>3</sup>.

$$\begin{aligned}
 &= 458 \text{ Lm}^3/\text{h} \times \text{Factors} \\
 &= 309.6 \text{ Lm}^3/\text{h}
 \end{aligned}$$

**MEASURING PRODUCTION ON-THE-JOB**

Three generally accepted methods of measuring bulldozer production are listed below. The third method is empirical, but is the simplest to conduct.

1. Employing Surveying Techniques
  - a. Conduct time study and then cross-section the cut to determine the volume of material removed. (Production in  $Bm^3$  or BCY per unit of time)
  - b. Conduct time study and then cross-section the fill to determine the volume of fill material. (Production in  $Lm^3$  or LCY per unit of time)
2. Weighing Blade Loads
 

Conduct time study and weigh material moved by bulldozer by weighing the loader bucket loads.
3. Measuring Blade Loads
  - a. Dozer operation
    - (1) Pick up and carry load onto a level area and stop.
    - (2) Raise the blade directly over the pile pulling forward slightly as blade comes up, leaving a nearly symmetrical pile.
    - (3) Reverse to clear the pile.
  - b. Measurements
    - (1) The average *height* (H) of the pile in feet. Hold the tape vertically at the inside edge of each grouser mark. Sight along top of the pile to obtain the correct measurement.

**TOP VIEW**

**SIDE VIEW**

**GROUSER MARKS**

- (2) The average *width* (W) of the pile in feet. Hold the tape horizontally over the pile and sight at the inside edge of each grouser mark and the corresponding opposite side of the pile.
- (3) The greatest *length* (L) of the pile in feet. Hold the tape horizontally over the pile and sight at each end of the pile.
- c. With the above measurements, now compute the blade load.
  - (1) Average the height measurement (H)
  - (2) Average the width measurement (W)
  - (3) Load ( $Lm^3$  or LCY) =  $0.0138 \times (HWL)$
  - (4) Load ( $Bm^3$  or BCY) =  $Lm^3$  or LCY  $\times$  LF
- d. Combine the calculated blade load with time study to figure production.

## Features:

- **Parallelogram linkage with hydraulically variable pitch** on D7E, D7R, D8R/D8T, D9R/D9T, D10T2 and D11T. Operator can adjust angle of ripper tip to the material for penetration at all ripping depths to increase production.
- **Fixed Parallelogram linkage design** used on D3K2, D4K2, D5K2, D6K2, D6N, D6R, D6R XL, D6T and D6T XL. This design holds tooth angle constant at all ripping depths.
- **Adjustable Single shank** arrangements available for D8R/D8T, D9R/D9T, D10T2 and D11T for tough ripping applications and deep ripping requirements.
- **Hydraulically Variable Pitch Multi-shank** arrangements available on D7E, D7R, D8R/D8T, D9R/D9T, D10T2 and D11T allow wide-beam coverage in easier-to-rip materials.
- **Counterweighted CarryDozer Ripper single shank** available for D11T and D11T CD, multi-shank available for D11T CD.

**DEFINITION OF FORCES SHOWN IN TABLES THAT FOLLOW**

“Pryout,” (Breakout) kilonewtons (and pounds) — the maximum sustained upward force, generated by the lift cylinders measured at the ripper tip. Breakout force is measured with the shank in the top hole, shank vertical and ripper full down. Breakout force may be hydraulically or balance limited.

“Penetration force,” kilonewtons (and pounds) — the maximum sustained downward force, generated by the ripper lift cylinders measured at the ripper tip, which is required to raise the back end of the vehicle with the tip on ground and the shank (pinned in the top hole) vertical.

\*Hydraulic pin puller is standard with deep ripping shank. Deep Ripping Arrangement maximum digging depth is 2.18 m (7'2").

\*\*Forces are for a ripper on a tractor equipped with an EROPS, U-Dozer and performance track. Forces will vary slightly with other vehicle configurations.

**TIP SELECTION FOR THE D8R/D8T, D9R/D9T, D10T2 AND D11T RIPPERS**

Three tip configurations (short, intermediate and long) in two styles (centerline and penetration) are available for economical operation in a variety of conditions.

**RECOMMENDED TIP USAGE**

*Short* — Use in high impact conditions where breakage problems occur. The shorter the tip, the more it resists breakage.

*Intermediate* — Most effective in moderate impact conditions where abrasion is not excessive.

*Long* — Use in loose, abrasive materials where breakage is not a problem. Generally offers the most wear material.

**Centerline vs Penetration**

The materials being ripped and the tractor doing the ripping will both have an effect on which tip will do the best job. High density material requires a “penetration” tip. High impact material requires a “centerline” tip. The following is a general guide to tip application.

Ripping Condition	Tips to use		
	D8R/D8T D9R/D9T	D10T2	D11T
Tandem Tractors . . . . .	Short	Short	Short
Single Shank and Multi-shank			
Extreme Duty . . . . .	Int.	Short	Short
Medium Duty . . . . .	Long	Int.	Int.
Abrasive Duty . . . . .	Long	Long	Long

Always use the longest tip that will wear without excessive breakage. Different tips should be tried to determine the most economical.

**ESTIMATING RIPPING PRODUCTION**

Ripping costs must be compared to other methods of loosening the material — usually drilling and blasting — on a cost per ton or bank cubic yard basis. Thus, an accurate estimation of ripper production is needed to determine unit ripping costs.

There are three general methods of estimating ripping production:

1. The best method is to record the time spent ripping, then remove (using scrapers or loaders and trucks) and weigh the ripped material. The total weight divided by the time spent will give hourly production. If the contractor is paid by volume, then a density must be used and the accuracy is only as good as the density used. For payment by volume removed, method 2 may be desirable. Some care will be needed to assure that only ripped material is removed.
2. Another method is to cross-section the area and then record the time spent ripping. After the material has been removed, cross-section the area again to determine the volume of rock removed. The volume divided by the time spent ripping gives the ripping rate per minute or hour.
3. Timing the ripper over a measured distance is the least accurate method, but valuable for quick estimating on the job. An average cycle time should be determined from a number of timed cycles. Turn-around or back-up time must be included. Measure the average rip distance, rip spacing and depth of penetration. This data will give the volume per cycle from which the production in bank cubic yards can be calculated. Experience has shown results obtained from this method are about 10 to 20% higher than the more accurate method of cross-sectioning.

An example of the measured distance method for calculating ripper production is:

*Data* — D10T2 — No. 10 with one shank.

910 mm (36 in) between passes.

1.6 km/h (1 mph) average speed (including slippage and stalls).

Every 91 m (300 ft) requires 0.25 min to raise, pivot, turn, and lower again: 91 m (300 ft) = 1 pass.

610 mm (24 in) penetration.

Full time ripping (no pushing or dozing assignment).

Example of Estimating Production (Metric)

Time per pass:

1.6 km/h = 26.7 m/min. Then  $\frac{91 \text{ m}}{26.7 \text{ m/min}} = 3.41 \text{ min};$

3.41 min + 0.25 min (turn time) = 3.66 min/pass.

If the operator works an average of 45 min per h, it is possible to make  $= \frac{45}{3.66} = 12.3 \text{ passes per h}$

Volume ripped:  $91 \text{ m} \times 0.9 \text{ m} \times 0.6 \text{ m} = 49.1 \text{ BCM}$  per pass

Production =  $49.1 \times 12.3 = 604 \text{ BCM per h}$

Remember the results from this method are usually 10 to 20 per cent higher than the actual production that can be expected on the job.

Example of Estimating Production (English)

Time per pass:

MPH = 88 fpm. Then  $\frac{300 \text{ ft}}{88 \text{ fpm}} = 3.41 \text{ min};$

3.41 min + 0.25 min. (turn time) = 3.66 min/pass.

If the operator works an average of 45 min per h, it is possible to make  $= \frac{45}{3.66} = 12.3 \text{ passes per h}$

Volume ripped:  $\frac{300 \times 3 \times 2}{27} = 66.7 \text{ BCY per pass}$

Production =  $66.7 \times 12.3 = 820 \text{ BCY per hr}$

**NOTE:** The demands of heavy ripping will increase the normal owning and operating costs of the tractor.

These costs should be increased no less than 30-40% in heavy ripping applications to estimate rock loosening costs.

There is no ready answer or rule-of-thumb solution to predict ripping production. Even if everything is known about the seismic velocity of the material, its composition, job conditions, equipment and operator, only a "guesstimate" can be given. The final answer must come from a production study obtained on the job site.

Sample problem (Metric)

Determine the loosening costs in the following situation:

Machine	— D10T2 Tractor with No. 10 Single Shank Ripper
Rip Spacing	— 915 mm
Ripper Penetration	— 610 mm
Rip Distance	— 91 m
Rip Time	— 3.41 minutes
Maneuver Time	— 0.25 minutes
Seismic Velocity	— 1830 meters per second
Assume	60 min. hour

*Solution:*

1. Total Cycle Time =  $3.41 + 0.25 = 3.66 \text{ min}$

$$\text{Cycles/hour} = \frac{60 \text{ min/hr}}{3.66 \text{ min/cycle}} = 16.4$$

2. Production per cycle =  $91 \text{ m} \times 0.9 \text{ m} \times 0.6 \text{ m} = 49.1 \text{ BCM/cycle}$

3. Production =  $49.1 \text{ BCM/cycle} \times 16.4 \text{ cycles/h} = 805 \text{ BCM/h}$

4. Remember results of this method are usually 10 to 20% high.

$$\begin{aligned} \text{Actual Production} &= 80\% \text{ of } 805 \text{ BCM/h} \\ &= 644 \text{ BCM/h} \end{aligned}$$

$$\text{Or } 90\% \text{ of } 805 \text{ BCM/h} = 725 \text{ BCM/h}$$

5. Owning and Operating Costs

A D10T2 (ripping only) could have a \$115.00/h O & O costs including \$30/h operator.

6. Loosening Costs

$$\$115.00/\text{hr} \div 644 \text{ BCM/h} = \$0.179/\text{BCM}$$

$$\$115.00/\text{hr} \div 725 \text{ BCM/h} = \$0.159/\text{BCM}$$

The loosening cost should range from 15.9¢ to 17.9¢/BCM

Sample problem (English)

Determine the loosening costs in the following situation:

Machine	— D10T2 Tractor with No. 10 Single Shank Ripper
Rip Spacing	— 3 feet
Ripper Penetration	— 2 feet
Rip Distance	— 300 feet
Rip Time	— 3.41 minutes
Maneuver Time	— 0.25 minutes
Seismic Velocity	— 6000 feet per second
Assume	60 min. hour

*Solution:*

1. Total Cycle Time =  $3.41 + 0.25 = 3.66$  min  

$$\text{Cycles/hour} = \frac{60 \text{ min/hr}}{3.66 \text{ min/cycle}} = 16.4$$
2. Production per cycle =  $\frac{300 \times 3 \times 2}{27} = 66.7$  BCY/cycle
3. Production =  $66.7 \text{ BCY/cycle} \times 16.4 \text{ cycles/hr} = 1094 \text{ BCY/hour}$
4. Remember results of this method are usually 10 to 20% high.  

$$\begin{aligned} \text{Actual Production} &= 80\% \times 1094 \\ &= 875 \text{ BCY/hr} \\ \text{or } 90\% \times 1094 &= 984 \text{ BCY/hr} \end{aligned}$$
5. Owning and Operating Costs  
 A D10T2 (ripping only) could have a \$115.00/hr  
 O & O costs including \$30/hr operator
6. Loosening Costs  

$$\begin{aligned} \$115.00/\text{hr} \div 875 \text{ BCY/hr} &= \$0.131/\text{BCY} \\ \$115.00/\text{hr} \div 984 \text{ BCY/hr} &= \$0.117/\text{BCY} \end{aligned}$$
 The loosening cost should range from 11.7¢ to 13.1¢/BCY

## USE OF SEISMIC VELOCITY CHARTS

The charts of ripper performance estimated by seismic wave velocities have been developed from field tests conducted in a variety of materials. Considering the extreme variations among materials and even among rocks of a specific classification, the charts must be recognized as being at best only one indicator of rippability.

Accordingly, consider the following precautions when evaluating the feasibility of ripping a given formation:

- Tooth penetration is often the key to ripping success, regardless of seismic velocity. This is particularly true in homogeneous materials such as mudstones and claystones and the fine-grained caliches. It is also true in tightly cemented formations such as conglomerates, some glacial tills and caliches containing rock fragments.

- Low seismic velocities of sedimentaries can indicate probable rippability. However, if the fractures and bedding joints do not allow tooth penetration, the material may not be ripped effectively.
- Pre-blasting or “popping” may induce sufficient fracturing to permit tooth entry, particularly in the caliches, conglomerates and some other rocks; but the economics should be checked carefully when considering popping in the higher grades of sandstones, limestones and granites.

Ripping is still more art than science, and much will depend on operator skill and experience. Ripping for scraper loading may call for different techniques than if the same material is to be dozed away. Cross-ripping requires a change in approach. The number of shanks used, length and depth of shank, tooth angle, direction, throttle position — all must be adjusted according to field conditions. Ripping success may well depend on the operator finding the proper combination for those conditions.

**D8R/D8T**

● Multi- or Single Shank No. 8 Ripper

● Estimated by Seismic Wave Velocities

**D9R/D9T**

- Multi- or Single Shank No. 9 Ripper
- Estimated by Seismic Wave Velocities

**D10T2**

● Multi- or Single Shank No. 10 Ripper

● Estimated by Seismic Wave Velocities

**D11T**

- Multi- or Single Shank No. 11 Ripper
- Estimated by Seismic Wave Velocities

**D11T CD**

● **Single Shank No. 11 Ripper**

● **Estimated by Seismic Wave Velocities**

**CONSIDERATIONS FOR USING PRODUCTION ESTIMATED GRAPHS:**

- Machine rips full-time — no dozing.
- Power shift tractors with single shank rippers.
- 100% efficiency (60 min hour).
- Charts are for all classes of material.
- In igneous rock with seismic velocity of 8000 fps (2450 mps) or higher for the D11T, and 6000 fps (1830 mps) or higher for the D10T2, D9R/D9T and D8R/D8T, the production figures shown should be reduced by 25%.
- Upper limit of charts reflect ripping under ideal conditions only. If conditions such as thick lamination, vertical lamination or any factor which would adversely affect production are present, the lower limit should be used.

# WINCHES PACCAR ALLIED

## CONTENTS

### PACCAR

Features . . . . .	19-84
Physical Specifications . . . . .	19-85
Operating Specifications . . . . .	19-95

### Allied

Features . . . . .	19-99
Physical Specifications . . . . .	19-100
Operating Specifications . . . . .	19-107

**PACCAR Features:**

PACCAR winches have been installed on Cat tractors since 1932. After acquiring the intellectual and property rights of Cat tail winches in the early 1990's, PACCAR Winch has exclusively supplied Caterpillar manufacturing facilities worldwide with tractor winches for factory installation.

**PA40 and PA50**

- **Closed loop hydrostatic operation** with variable displacement motor and dedicated variable displacement pump for maximum winching power and flexibility.
- **Infinitely variable control** of line speed and line pull including positive inching control at maximum rated line pull.
- **Standard full-function “power-in” and “power-out” control.** This is optional on some competitive winches.
- **Standard “drive-away”** to maintain tension on the cable when driving the tractor away from a stationary load.
- **Standard “free spool”** to allow cable to be pulled off the winch by hand.
- **Durable cast winch case** with fairlead mounting lugs, log arch mounting lugs, and heavy duty drawbar.

**PA55, PA56 and PA80**

- **PTO mechanical winch drive** with full tractor engine power available to the winch.
- **Self-contained internal hydraulic control system** for easy installation.
- **Equal speed gearing in “reel-in” and “reel-out”** to provide smooth and predictable performance.
- **Standard “drive-away”** to maintain tension on the cable when driving the tractor away from a stationary load.
- **Standard “free spool”** to allow cable to be pulled off the winch by hand.
- **Durable cast winch case** with fairlead mounting lugs, log arch mounting lugs, and heavy duty drawbar.

**PA90, PA110B, PA140 and H200**

- **Hydraulically driven winch** for infinitely variable control of line speed and line pull including positive inching control at maximum rated line pull.
- **Optimized “high power” hydraulic control system** including specialized directional control valve for maximum winching power and flexibility.
- **Dual braking system** provides a static brake with sprag clutch to eliminate fall-back and a hydraulic brake valve for dynamic braking.
- **Single lever joystick control** for ease of operation.
- **Fabricated steel winch case** with integral heavy duty drawbar provides excellent durability and easy weldability.
- **Standard three-roller fairlead** for improved wire rope life during side pulls.

**H60, H110B and H140**

- **Hydraulically driven winch** for infinitely variable control of line speed and line pull including positive inching control at maximum rated line pull.
- **Standard Cat ripper control system** is employed for winch “power-in” and “power-out” functions.
- **Winch installation time is reduced by up to 70%** compared to “high power” installations.
- **Easy field interchangeability between winch and ripper.**
- **Dual braking system** provides a static brake with sprag clutch to eliminate fall-back and a hydraulic brake valve for dynamic braking.
- **Durable cast (H60) or fabricated steel (H110B and H140) winch case** with integral heavy duty drawbar.
- **Three-roller fairlead** for improved wire rope life during side pulls is standard on H110B and H140 and optional on H60.
- **“Free spool”** to allow cable to be pulled off the winch by hand is standard on H60.

<sup>(1)</sup>“Maximum line pull” is lesser of winch catalog rating or calculated maximum line pull at maximum hydraulic system pressure.

<sup>(2)</sup>“Rated line speed” is calculated maximum line speed at maximum hydraulic system pressure and flow with winch motor at maximum displacement.

<sup>(3)</sup>“Maximum line speed” is calculated maximum no-load line speed at maximum hydraulic system flow with winch motor at minimum displacement.

<sup>(4)</sup>“Full Drum” as defined by SAE J1158.

**Allied Features:**

- **Proven performance on Caterpillar.** Allied winches trace their roots to Hyster winches on Cat tractors since 1929. Allied acquired Hyster winches in 1990, maintaining the same engineering excellence. Existing dealer parts inventory continues to be interchangeable to support the thousands of Allied/Hyster winches in the field.
- **“Plug and Play” design.** Winches come complete with all the necessary parts for simple and easy field installation on any tractor. They do not require Winch Ready packages pre-ordered on the tractors. This simplifies dealer inventory planning.
- **Self-Contained Hydraulics (SCH) design.** All hoses, pump and valve are inside the PTO winch frame, totally eliminating external leakage.

**Standard Equipment**

- Freespool function for W3C, H4A, W5C, H5C, W6F, W6G and H6H winches. Adjustable freespool drag to allow cable to be pulled out easily by hand.
- Heavy duty box-section winch frame withstands demanding side pulls without the need for fairlead.
- Brake off function for most winches. Keeps cable tight while the tractor drives away to prevent cable bird nesting.
- Multiple-disc oil clutches and brake on PTO winches are oil-cooled for long life.
- Drawbar for most winches. Provides an additional hitch for load towing.
- Power line-in and power line-out.

**Optional Equipment**

- Fairlead to handle frequent side pulls from all angles. Hardened vertical and horizontal rollers reduce cable wear.
- Arch works like a raised fairlead to lift loads off ground for efficient skidding.
- Choice of standard gear ratio for fast operation in logging, or slow speed gear ratio for fine speed control in pipelaying and power line sagging applications.
- Electronic control for precise speed control.

**Two families of winches – Power Take-Off (PTO) driven or Hydraulically driven winches covering D3 through D10 tractors, pipelayers and track loaders, the most comprehensive winch in the industry.**

- **PTO** winches able to utilize full range of engine power. Brute force and fast line speeds.
- **Hydraulic** winches provide fingertip precision control over line speed. Motor only turns on demand equaling less wear and maintenance.

**Winch Selection Guide:**

Tractor Class*	PTO Winch	Hydraulic Winch
D3-5K	—	H4A
D6K	—	H5C
527 TSK	W6F	—
D6N, D5R	W5C, W6G, W6F	H5C, H6H

Hard Rock Roof Support HRS1220	20-29

### Features, all models:

- Rugged design for underground application.
- Engineered for productivity, reliability, safety and machine rebuildability.
- Extensive use of steel castings and forgings.
- Cat® heavy duty diesel engines and power trains.
- Computerized machine function monitoring.
- Four wheel enclosed wet disc brakes.
- Remote Control Interface Group options on loaders.
- Payload control system option on loaders.
- Ride control system optional on loaders.
- Fully enclosed air conditioned operator stations available.
- Operator Stations are FOPS certified.

### Product Line:

- Five models of Load-Haul-Dump (LHD) machines, with rated bucket payloads ranging from 6800 kg (14,991 lb) to 20 000 kg (44,100 lb).
- Four models of articulated dump trucks, with payload capacities of 30 000 kg (66,140 lb) to 60 000 kg (132,277 lb).

## ROCK FLOW SYSTEM

### Introduction

The innovative Cat Rock Flow System is a continuous production system for block caving operations. This special mining system combines the usage of a Rock Feeder, a Rock Mover and an automation system to deliver mass mining production with improved safety and sustainability.

The Rock Feeder RF300 extracts ore from the draw-point onto a Rock Mover [Hard Rock Chain Conveyor] by a hydraulically operated push plate.

The Rock Mover RM900 is a dedicated hard rock production conveyor that collects ore from various draw-points. The Rock Flow Automation System (featuring remote operation from surface) allows draw and quality control and records operational data.

### Features

- Continuous mass mining production system increases productivity.
- Highly automated system providing real time draw control.
- Easy maintenance and clearance work.
- Use of electric drives increases safety, reduces cost and improves underground climate and carbon footprint.

Hydraulic Return Unit:		
Option 1:	<b>Manually adjustable unpowered</b>	
Option 2:	<b>Fully activated</b>	

## ROCK STRAIGHT SYSTEM

### Introduction

The Cat Rock Straight System is a fully mechanized longwall system adopted to hard rock conditions for continuous mining of flat and tabular deposits and reefs. The Rock Straight System combines the use of a hard rock shearer (Hard Rock Miner HRM220), a hard rock chain conveyor (Hard Rock Conveyor HRC30) and hydraulic roof support (Hard Rock Roof Support HRS1220). It features the adaptation of the newly developed “Cat Activated Undercutting Technology” and has been particularly designed for the extraction of bedded hard rock deposits (e.g. copper, gold).

The Rock Straight System particularly provides economical cutting in the mining of thin seams and narrow veins, especially when selective mining of ore is required.

The powerful Hard Rock Miner HRM220 is designed for continuous cutting operation in low seam heights of between 1.3 to 2.0 m (4.2 to 6.6 ft). The two cutting units can be adjusted in terms of height to maximize the productivity of a single cutting sequence. A haulage speed of up to 6 m/min (19.7 ft/min) in combination with a maximum cutting depth of 100 mm (3.9 in) delivers high production rates.

The HRC30 is a newly developed apron face conveyor to suit hard rock applications. Its design is extremely flat, nevertheless sturdy, to transport hard rock in low cutting heights. The conveyor’s modular architecture can be tailored to suit face lengths of up to 100 m (328 ft).

The HRS1220 Hard Rock Roof Support provides customers with state-of-the-art technology to maximize the control of the surrounding rock. They have been specifically engineered to meet the difficult conditions in hard rock mining. Hydraulic cylinders combined with advancing rams guarantee a high level of mechanization.

**Features**

- **Productive** — The Rock Straight System is designed for a continuous cutting operation. The combined use of the hard rock miner (cutting and loading of the material) and the face conveyor (transporting/moving the material) represents a system for simultaneous cutting and hauling — a fast and cost-effective solution generating greater return of investment.
- **Efficient** — The Rock Straight System is tailored to operate in low seam heights — it follows the seam and maximizes the output of cut hard rock material mined out, and leaves waste rock formation above the low seam untouched.
- **Reduces Risks to Health and Safety** — The hydraulically operated hard rock miner and electrically driven hard rock conveyor significantly improve the underground climate and system carbon footprint.
- **Automated** — The fully automated continuous cutting, loading and hauling operation optimizes the process flow and makes hard rock cutting more efficient by shortening the excavation cycle.
- **Safe in Operation** — Cutting of hard and highly abrasive rock reduces or eliminates the need for explosives where it is used. Furthermore, a remote control operation provides optimum comfort and safety for operators, as the operator is placed in a RSPS (FOPS equivalent) certified cabin with air conditioning. This makes job conditions more attractive and lowers operating cost because fewer personnel is needed underground.
- **Service and Maintenance Friendly** — The modular architecture and the compactness of its components support a trouble-free handling. This results in shortened downtimes for repair, maintenance and panel moves.

Hard Rock Miner HRM220

<b>A</b> Seam Range	1.3 m-2.0 m	4.2'-6.6'
<b>B</b> Typical Machine Length	6.8 m	22'4"
<b>C</b> Cutting Head Diameter	1270 mm	50"
Installed Power Hydraulic System	55 kW	73.3 hp

## INTRODUCTION

Caterpillar is the global market leader and supplier of complete longwall systems. All over the world, our equipment and systems are meeting the demands of underground mining under the most stringent conditions. Adapted to the mining challenges faced by our customers today, Cat customized systems range from hydraulic roof supports, automated plow systems, shearers, face conveyors and drive systems to automation and roof support carriers. Caterpillar delivers your system of choice, from low to high seam heights, for the longest longwalls and highest production demands.

## ROOF SUPPORTS

### Features

### Equipment You Can Rely On

- Availability typically 98% on average.
- Extensive tests on all structural, hydraulic and control components.
- Sophisticated PMC-R electro-hydraulic controls for full face automation.
- Down to 4-second advance cycles thanks to powerful hydraulics.
- Shield design in 3D, FEM integrated.

### Customized Design

- Seamless range for mining heights from 0.55 to 7.5 m (1.8 to 24.6 ft) with support capacities of up to 1750 metric tonnes (1929 tons).
- Advanced design of critical parts prevents major failures, costly underground repairs and unscheduled downtime.
- Easy maintenance, long intervals between overhaul and very long service life.

**Cat Roof Supports**

Height Closed	500-2900 mm	19.7-114.2"
Height Extended	1100-6100 mm	43.3-240.2"
Shield Centers	1500-2050 mm	59-80.7"
Nominal Leg Forces	2 x 800-2 x 7156 kN	2 x 90-2 x 805 ton
Shield Density	Up to 111 tonne/m <sup>2</sup>	Up to 12.5 ton/ft <sup>2</sup>
Hydraulic Leg	Up to 500 mm	Up to 19.7"
Canopy	<b>Rigid design (with telescopic flipper)</b>	
Canopy Length	2997-8000 mm	118-315"
Forepole Length	1980-4520 mm	78-178"
Rear Projection	850-1448 mm	33.5-57"
Base	<b>Split design OR rigid design with telescopic relay bar/pusher cylinder</b>	
Relay Bar		
Direct Mounted OR Reverse Mounted	650-1067 mm effective web	25.6-39.4" effective web
Shifting Cylinder (with Reedrod)	700-1080 mm	27.6-42.5"
Shield Pull Force	185-565 kN/ 315/320/350 bar	20.7-63.3 ton/ 4568/4640/5076 psi
Conveyor Push Force	89-815 kN/ 315/320/350 bar	10.0-91.5 ton/ 4568/4640/5076 psi
Side Seals-on Canopy, Caving Shield (and rear lemniscates):		
Both Sides Fixed/One Side Fixed, One Side Movable, Rehandable/Not Rehandable	Up to 300 mm stroke	Up to 11.8" stroke
Materials	<b>High strength steel</b>	
Test	<b>EN 1804, different test program with up to 90,000 cycles</b>	
Weight	6.5-63.5 tonne	7.15-70 ton

**Roof Support Specifications**

**Example High Seam Roof Support**

**Example Low Seam Roof Support**

**Special Applications**

Specifically designed roof supports are available for the following mining applications:

- Steep-seam Mining

- Conventional Sublevel Caving

- Longwall Top Coal Caving (LTCC)

## AFC SYSTEMS

### Features

### Moving Mountains

- For use in longwalls of up to 500 m (1640 ft) long.
- Up to  $3 \times 1800$  kW ( $3 \times 2413$  hp) installed power.
- Capacities of up to 6200 tonnes/hr (6834 tons/hr).
- Intelligent CST drive system available.
- High system availability, long service life, low operating costs.
- Various shearer haulage systems with rack bar or chain.
- Main drive: Cross-frame, side discharge, overhead discharge.
- Rigid or automated tensionable tail drive.

**BEAM STAGE LOADERS (BSL)**

The AFC is continuously running and conveys the coal mined by a shearer or plow to the head gate, where it is transferred onto the beam stage loader (BSL) with integrated crusher and then onto the main belt (eventually to the surface).

**Main Functions of a BSL:**

- Transportation of the coal from the AFC and hand-over to the belt conveyor.
- Crushing of coal blocks to smaller sizes to suit belt capability.

**Features**

- Stageloader and crusher completely matched to AFC, both with higher capacity to prevent bottlenecks.
- Tailor-made belt tailpiece for required capacity and belt dimensions, allowing BTP to handle longitudinal and lateral entry gradients.
- Horizontal crusher for high throughput and low operating costs due to double action impact elements.
- Automated chain tensioning system for enhanced chain and sprocket lifetime. As option SlackTronic available for superior chain tension management.
- Patented PowerChain technology available.

## CST DRIVE SYSTEMS

### Features

### The Drive for Productivity

- No-load motor start-up with minimized energy demand on the electrical system.
- Soft start of the face conveyors which is gentle to all components, particularly the chain.
- Maximum total torque, available to facilitate heavy load start-up of the fully loaded conveyor.
- Accurate load sharing between the drives for full utilization of the installed power.
- Excellent overload protection in the event of sudden chain jams.
- Clutch delivers maximum efficiency with minimum operational slip of 0.2% with no wear.

## Variable Frequency Drives

### Features

**Air-Cooled VFD Container**

**Liquid-Cooled VFD Container**

The application of VFD brings a significant improvement for the plow and AFC operation. It implements among others the following advantages:

- **High Power System Stability/Quality**
  - Application of standard asynchronous motors.
  - Distance between motors and powering VFDs up to 4 kilometers (2.4 miles).
  - The usage of “weaker” networks is possible.
- **No EMC-Effects**
  - $du/dt$  is small, no special requirements to motor’s insulate performance.
  - No overvoltages and reflection waves.
  - No high-frequency interference by pulsing circuit of IGBT.
  - No network perturbations by large harmonic wave components.
  - No parasitic ground currents.
- **Variability/Dynamic of the Drive System**
  - Variable speed for AFC and plow in a wide range (0 to 120% of nominal speed).
  - Greater dynamic of drive system.
  - Unlimited start-ups of the motors.
  - No significant voltage drop during start-ups.
  - Reduction of mechanical stress.
- **Synchronicity and Precision/Utilization of the Full Power**
  - High constant torque throughout the entire speed range from 0 to maximum speed.
  - Full utilization of installed power on both plow’s motors through load shearing.
  - Synchronized start-up of all drives at full load.
  - Controlled load distribution between all drives.
  - Torque control function makes motor work with constant torque.
  - External encoder interface for speed feedback.
  - Moment and speed parameterizable.
- **Low Life Cycle Costs**
  - Reduction of impact of drive system on chain, line pans and chain sprockets.
  - Quick torque and speed reduction in case of blockades or chain cracks.
  - Improvement of overload protection for motors and chains.
  - Detection of chain break through controlled shut down.
- **Energy Recovery**
  - Breaking possibilities and thus returning power back to the network.
- **Maximum Torque at Zero Speed**
  - Total torque control at zero speed.
  - Tension of the chain without a chain tensioning unit.
- **Monitoring System**
  - System parameter (voltage, power, torque, effective power, speed, etc.) are directly (online) available.
- **Optional Functions**
  - Evenly distributed load of conveyor by adjustment of speed depending on the direction of motion of the extraction machine (optional).
  - Adjustment of profit performance depending on capacity utilization of downstream systems (optional).

## Shearers

### Features

### Taking the Shearer to the Next Level

- Cat shearers meet the demands of the world's leading longwall operators in medium to high seam mining.
- Highest reliability due to own test center.
- Power for the toughest mining conditions.
- Robust design and unique mainframe concept.
- Unparalleled control with world-leading automation capabilities.
- Seam range: 1.8–7.0 m (5.9–23.0 ft).
- Installed power of up to 2295 kW (3078 hp), cutting speed up to 45 m/min (150 ft/min).
- Maximum capacity: 5000 tonnes/hr (6063 tons/hr).

### Specialized Shearers

Caterpillar also supplies shearers for specialized applications:

- Single- and double-drum low-seam shearer.
- Three-drum shearer for selective mining.

These shearers utilize the key feature of modular mainframe construction and are proven for coal and non-coal applications.

### Ranging Arms

Two types of ranging arm, both designed and robustly tested, for longer service life.

	RA750	RA860
EL2000	●	
EL3000	●	●
EL4000		●

### RA750

- Transmission rating of 750 kW @ 37.4 RPM and above
- Maximum drum diameter of 2500 mm (98 in)
- Choice of drum speeds
- Complete with 32 mm (1.3 in) bore, through shaft PFF/PBF wet cutting
- Square drum hub (440 mm [17.3 in] across flats)
- Maximum oil capacity of 28 L (7 gal) in high speed compartment and 30 L (8 gal) in the epicyclic
- Integral monitoring transducers
- Quillshaft transmission protection
- A robust cowl drive mechanism is also available on both models (EL2000, EL3000)
- Online vibration monitoring with VibraGuard
- Available cutting motors:
  - EL2000 500 kW, 620 kW and 750 kW @ 50 Hz (800 hp, 1000 hp and 1200 hp @ 60 Hz)
  - EL3000 620 kW and 750 kW @ 50 Hz (1000 hp and 1200 hp @ 60 Hz)

### RA860

- Transmission rating of 860 kW @ 30.8 RPM and above
- Maximum drum diameter:
  - EL3000 2750 mm (108 in)
  - EL4000 3500 mm (138 in)
- Choice of drum speeds
- Complete with 32 mm (1.3 in) bore, through shaft PFF/PBF wet cutting
- Square drum hub (630 mm [24.8 in] across flats)
- Maximum oil capacity of 45 L (12 gal) in high speed compartment and 60 L (15.85 gal) in the epicyclic
- Integral monitoring transducers
- Quillshaft transmission protection
- A robust cowl drive mechanism is also available
- Online vibration monitoring with VibraGuard
- Available cutting motors — 750 kW and 860 kW @ 50 Hz (1200 hp and 1380 hp @ 60 Hz)

**Haulage Units**

	HU125	HU150
EL2000	●	
EL3000		●
EL4000		●

**Haulage Unit — HU125**

Total Machine Pull	945.51 kN 96.80 tonnes	<b>212,559 lbf</b> <b>106.70 tons</b>
Speed at Maximum Pull	14.28 m/min	<b>46.83 ft/min</b>
Maximum Machine Speed	28.56 m/min	<b>93.66 ft/min</b>
Pull at Maximum Speed	472.75 kN 48.40 tonnes	<b>106,278 lbf</b> <b>53.35 tons</b>

- Maximum power rating 125 kW (168 hp)
- Integral water cooling @ 9 L/min (2 gal/min)
- Transmission reduction of 137:1
- Maximum oil capacity of 25 L (7 gal)
- Integral monitoring transducers
- Quillshaft transmission protection
- This unit has a haulage motor rating of 125 kW (168 hp)
- Available with Machine Position Encoder
- Available with Machine Parking Brake

**Haulage Unit — HU150**

Total Machine Pull	1075.94 kN 110.15 tonnes	<b>241,881 lbf</b> <b>121.42 tons</b>
Speed at Maximum Pull	15.06 m/min	<b>49.39 ft/min</b>
Maximum Machine Speed	30.11 m/min	<b>98.77 ft/min</b>
Pull at Maximum Speed	537.97 kN 55.07 tonnes	<b>120,940 lbf</b> <b>60.70 tons</b>

- Maximum power rating 150 kW (201 hp)
- Integral water cooling @ 9 L/min (2 gal/min)
- Transmission reduction of 137:1
- Maximum oil capacity of 25 L (7 gal)
- Integral monitoring transducers
- Quillshaft transmission protection
- This unit has a haulage motor rating of 150 kW (201 hp)
- Available with Machine Position Encoder
- Available with Machine Parking Brake
- Online vibration monitoring with VibraGuard

**Down Drives**

	DD125	DD150
EL2000	●	
EL3000		●
EL4000		●

**Down Drive — DD125/DD150**

- Innovative and unique downdrive design
- Transmission rating:  
DD125 125 kW (168 hp)  
DD150 150 kW (201 hp)
- Maximum haulage pull:  
DD125 945 kN (107 tons)  
DD150 1075 kN (123 tons)
- Fully removable, rehandable, modular gearbox
- Removable modular top drive wheel assembly (cartridge)
- Downdrive ratio:  
DD125 17T-23T-10T (two wheel configuration)  
**EL3000:**  
DD150 22T-31T-11T (two wheel configuration);  
available with three wheel configuration  
(27T idler)  
**EL4000:**  
DD150 22T-27T-31T-11T (three wheel configuration)
- Trapping shoe with replaceable wear inserts, safe and easy replace (unique to Caterpillar)
- Suitable for all current track-type systems

**Powerpack**

	PP2	PP3
EL2000	●	
EL3000		●
EL4000		●

**Powerpack — PP2/PP3**

- Fixed displacement pump, with a capacity of:  
PP2 50 L/min (13.21 gal/min)  
PP3 200 L/min (53 gal/min)
- Operating system pressure:  
PP2 260 bar (3770 psi)  
PP3 210 bar (3046 psi)
- Robust hydraulic reservoir; capacity:  
PP2 165 L (43.6 gal)  
PP3 300 L (79 gal)
- Integral monitoring transducers
- For use with ISO 68 or ISO 100 hydraulic oils
- Available with 6 (PP2, PP3) or 8 (PP3) valve bank (dependent on function requirement)
- Available with two speed ranging arm facility (EL4000)
- This unit has a pump motor rating of:  
PP2 30 kW @ 50 Hz (48 hp @ 60 Hz)  
PP3 75 kW @ 50 Hz (120 hp @ 60 Hz)

**Mainframe**

	MF2	MF3	MF4
EL2000	●		
EL3000		●	
EL4000			●

**Mainframe — MF2/MF3/MF4**

- High structural integrity and absorption of all cutting and haulage forces, providing maximum protection of all major units
- Maximum protection of electrical boxes, providing the highest level of flameproof integrity
- Improved access for maintenance and ease of overhaul and repair
- Versatility of application due to fully modular construction
- A split mainframe is available in case of transportation limitations

**Hydraulically Activated Top Guards**

- EL3000 and EL4000 are equipped with hydraulically activated top guards

**Electrical Control Box**

	ECB2	ECB3
EL2000	●	
EL3000		●
EL4000		●

**Electrical Control Box — MF2/MF3/MF4**

- This flameproof module contains the majority of the shearer electrical control and power distribution components
- High current carrying capacity of 400 amps (ECB2) or 500 amps (ECB3) and can accommodate trailing cables up to 185 mm<sup>2</sup> [ECB2] (2.9 in<sup>2</sup>) or 240 mm<sup>2</sup> [ECB3] (9.4 in<sup>2</sup>)
- All internal chassis can be ‘bench built,’ tested and stored
- Box contains various low voltage (LV) circuit breakers which can be reset through the flameproof cover (FLP) cover, reducing downtime
- An extremely powerful PMC Evo-S control system with state-of-the-art Ethernet communication and backup functionality, this allows the shearer to be operated even if the overall control system is not functioning
- This unit also contains cutter motor contactors, circuit breakers, control transformers, current monitoring, high voltage (HV) fuses, earth leakage and both visible disconnects

### Haulage Transformer Box

	HTB2	HTB3
EL2000	●	
EL3000		●
EL4000		●

### Haulage Transformer Box — HTB2/HTB3

- This flameproof model contains the main 253 kVA (HTB2)/350 kVA (HTB3) haulage transformers, power supplies, auxiliary transformer, drive system circuit breaker and  
HTB2 one 250 kW, 600V AC inverter drive  
HTB3 two 200 kW, 600V AC inverter drives with regenerative braking module

### Electrical Material

- All three models are available with headlights, cameras, methane monitoring, end displays and audible alarms
- All electrical material is designed and certified to IEC standards and also complies with other regional and national standards, such as MSHA, EAC/Ex, MA, ATEX and DGMS, as well as Australia's New South Wales and Queensland regulations

### Hydraulic Material

- All hose assemblies are to ISO 6805 and proof tested to EN ISO 1402
- The hoses are assembled to Hose Assembly Standard DIN20066:201-10
- All hose and hosing is in compliance with guideline MDG 41 and MSHA regulations

### Water Material

- All hose assemblies are to ISO 6805 and proof tested to EN ISO 1402
- The hoses are assembled to Hose Assembly Standard DIN20066:201-10
- All hose and hosing is in compliance with guideline MDG 41 and MSHA regulations
- All three models are available with onboard filtration, dust suppression spray bars, shearer clearers and ranging arms spray rings

### Health Monitoring

- A comprehensive health monitoring system is available, including oil levels and temperatures, flows, pressures and vibration analysis

**Machine Automation and Communication**

- Industry-leading Automation from the Pioneer of State-based Automation.
- The shearers have a state-of-the-art distributed automation system for the control, monitoring and protection of the shearers. Its modular design allows it to be configured to meet individual control needs, from basic monitoring and protection to advanced automation and data transmission.
- The PMC Evo-S control system with state-of-the-art Ethernet communication and backup functionality allows the shearer to be operated even if the overall control system is not functioning.
- The shearer is equipped with a state-of-the-art industry PC in a flameproof housing with plenty of computing power, allowing flexibility to upgrade to future features such as condition monitoring.
- A Programmable Logic Controller (PLC) takes care of basic machine control tasks, ensuring that coal is produced.
- Unlike competitor systems, the modularity of the longwall system to operate in “fault-tolerant” mode, even when there is a problem with the overall automation system.
- In other words, integrated automation does not prevent control via individual PLC’s in order to keep production up and running.
- Levels of automation:
  - Zone-based automation “Navigator 1”
  - State-based shearer automation “Navigator 2”
  - Integrated longwall automation with “Navigator 2+3”
  - “Longwall Navigator” for improved face alignment and horizon control

**Optional Machine Mounted Coal Sizer — CS200 (EL3000 and EL4000)**

- Transmission rating of 200 kW @ 50 Hz (320 hp @ 60 Hz)
- Quillshaft transmission protection
- Drum speed of 200 RPM (240 @ 60 Hz)
- Drum diameter 900 mm (35.5 in) over picks
- Integral water cooling for transmission and motor
- Square drum hub drive for drum
- Complete with anti-shock lift mechanism (unique to Caterpillar)
- Available motor rating 200 kW @ 50 Hz (320 hp @ 60 Hz)

## AUTOMATED PLOW SYSTEMS

### Features

### High-level Automation

- Preferred longwall mining machine for seams under 1.8 m (5.9 ft).
- Fully automated longwall mining system for medium and thin seams from 0.8–2.3 m (1.8–7.5 ft).
- High traveling speed up to 3.6 m/sec (720 ft/min).
- Most powerful system available with up to  $2 \times 800$  kW ( $2 \times 1080$  hp).
- Maximum capacity 3500 tonnes/hr (3858 tons/hr).
- Overload protection.
- Load sharing.
- Minimum dust generation.
- Low operating costs.
- Effective horizon control and incremental plowing for full automation without operators being required on the face.

**PMC-R**  
**Roof Support Control**

The intrinsically-safe Cat PMC-R control units are used on shearer or plow faces to provide medium to high level of longwall automation. Each Roof Support needs to be equipped with one PMC-R control unit, a solenoid driver to operate the in-shield hydraulic functions and a set of peripheral components, like sensors for pressures and shield advance.

The PMC-R can control and display all functions of a shield and is simultaneously the interface between operator and machine (HMI).

The PMC-R system can control all individual shield functions based on a reliable network. As an interactive system, it allows the user to execute single shield functions as well as automatic functions. Important process values are continuously displayed as feedback for the operator.

**Features PMC-R Control Unit**

- Robust design (OS4/OS8 plugs, hose cables, stainless steel housing)
- IP 68 rating (48 h under @ 1 m [3.28 ft] under water)
- Separate Quick Stop and Local Lockout switches
- HMI with 30 multi feedback keys (sound, pressure point, led light)
- Two (2) line LCD graphical display
- Multi language support
- Maintainability (brass bar mounting, screws from the front)
- Integrated infrared
- Can control up to three (3) separate solenoid driver boards

**Front View of the PMC-R**

**Dimensions (All dimensions are approximate.)**

<b>A</b> Width	178 mm	<b>7.01"</b>
<b>B</b> Height	116 mm	<b>4.57"</b>
<b>C</b> Length	320 mm	<b>12.60"</b>

Dimensions (All dimensions are approximate.)

<b>A</b> Width	178 mm	7.01"
<b>B</b> Height	116 mm	4.57"
<b>C</b> Length	320 mm	12.60"

Exemplarily System Layout of a PMC-R System (Shearer Face)

Together with the following peripheral equipment the PMC-R controller forms an individually per customer order designed control system for Longwall automation.

- Solenoid Driver Board (minimum one per Roof Support)
- Pressure Sensor
- Reed Rod
- Proximity Switch
- IR Transmitter and Sensor
- LED Warning Light
- IS Power Supply
- Diverse Data Coupler
- 3D-Tilt Sensor and 3D-Tilt Monitor
- Double Solenoid Valve

Such a PMC-R control system consists typically of more than a hundred similar subsystems set up by a PMC-R controller, solenoid driver, sensors, and valves per roof support and one time used hardware at the gate ends as server controllers, IPC, communication modules, chain tensioner, etc.

#### **Main Features PMC-R Control System**

- “Distributed Intelligence in each shield”
- Wide range of sensors and multiple solenoid drivers
- Easy diagnosis through communication between PMC-R controls
- Various auto sequences
- Automated conveyor push modes
- Conveyor pullback functions
- Automated water spray functions

- Outrigger steering for conveyor steering (mostly plow faces)
- Automation of:
  - Block anchorage
  - Flipper
  - Sliding canopy
  - Gap shield
  - Several steering cylinder automation modes dependent on roof conditions

Via a decentralized visualization and control unit at the face and/or the surface supports MineStar capabilities, especially HEALTH for Longwall.

The entire PMC-R system provides different global certifications:

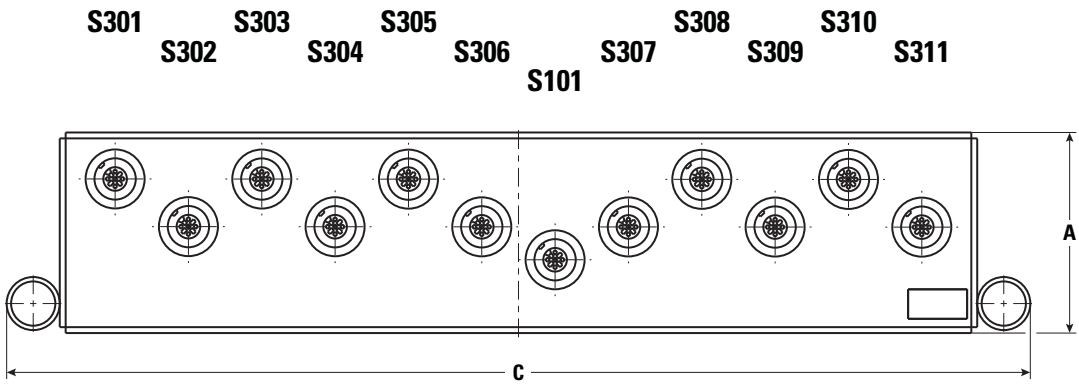

- Europe: ATEX
- U.S.: MSHA
- Russia: EAC/Ex
- Australia: IECEx, ANZEx
- China: MA
- More certifications on demand

#### **Solenoid Driver Module**

The PMC-R solenoid driver module is placed at a distance from the PMC-R in accordance with the modular concept. The solenoid driver module can activate up to 22 valve functions, additional lights and sound modules or relays. As well, additional sensors could be read in by the solenoid driver module.

Solenoid Driver Module

**Dimensions (All dimensions are approximate.)**

<b>A</b>	Width	68 mm	2.68"
<b>B</b>	Height	37 mm	1.46"
<b>C</b>	Length	347 mm	13.66"

## PMC-D and PMC-V

### Drive Control Unit and HMI (Human Machine Interface)

The intrinsically-safe PMC-D control is used on shearer or plow faces to provide high level AFC (armed face conveyor) and plow automation. Each Drive unit needs to be equipped with one PMC-D control unit and equivalent I/O to operate the CST drives or UEL gearbox functions.

The PMC-V provides in such a system the HMI to interact with the PMC-D controls to operate manual mode, visualize and change parameters and show actual process values. Within a PMC-D system minimum one and typically up to 3 PMC-Vs are in equal operation.

The PMC-D system can control extremely sensitive the speed and torque of highly powered AFC CST drive. Using Profibus network all PMC-Ds and PMC-Vs in a system could exchange process data over long distances with high frequency.

### Attributes of PMC-D/PMC-D20 Control Unit

- Robust stainless steel design
- Highly reliable OS37 plug technology for complete gearbox control
- SKK24 hose cables for bus system and additional I/O connection
- IP 68 rating (48 h under @ 1 m [3.28 ft] under water)
- HMI with 24 multi feedback keys (pressure point, led light)
- 63.5 mm (2½") graphical monochrome display
- Multi language support
- Maintainability (brass bar mounting)
- Optional eight (8) additional ports for acceleration sensors (PMC-D20)

## PMC-D

### PMC-D Dimensions and Plug Assignments (All dimensions are approximate.)

<b>A</b> Width	278 mm	10.94"
<b>B</b> Height	148 mm	5.83"
<b>C</b> Length	335 mm	13.19"

PMC-D20

**PMC-D20 Dimensions and Plug Assignments (All dimensions are approximate.)**

<b>A</b> Width	279 mm	10.98"
<b>B</b> Height	125 mm	4.92"
<b>C</b> Length	335 mm	13.19"

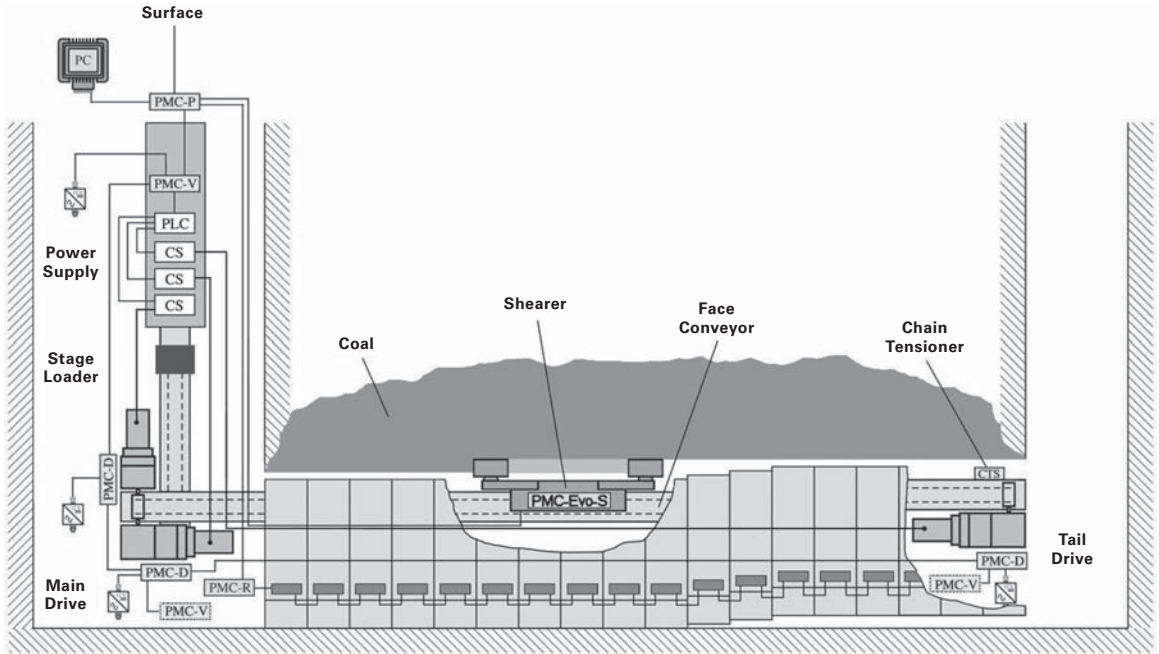

PMC-V

**PMC-V Dimensions (All dimensions are approximate.)**

<b>A</b> Width	241 mm	9.49"
<b>B</b> Height	148 mm	5.83"
<b>C</b> Length	335 mm	13.19"

Exemplarily System Layout of a PMC-D System (Plow Face)

**Main Features of the PMC-D Drive Control System**

- “Distributed controller Intelligence per drive”
- Synchronized heavy load start up
- Soft startup
- Load sharing between conveyor drives
- Overload protection
- Motor braking feature
- Further used in plow operations:
  - Precise position detection
  - Overload protection

**Additional Features**

- Usage of PMC-D for chain tensioning of AFC (front and rear conveyor) and BSL
- In conjunction with Slacktronik® direct BLS chain slack control and relating chain tensioning
- Usage of PMC-D for high accurate plow position control and monitoring
- Support VFD controlled drive applications
- Optional integration of “HEALTH for Longwall Vibration Analysis” function with PMC-D20 control unit:
  - Acceleration sensor interface for eight (8) sensors
  - Integrated communication for vibration analysis

The entire PMC-D system provides different global certifications:

- Europe: ATEX
- U.S.: MSHA
- Russia: EAC/Ex
- Australia: IECEX, ANZEx
- China: MA
- More certifications on demand

Via a decentralized visualization and control unit at the face and/or the surface supports MineStar capabilities, especially HEALTH for Longwall.

**HEALTH for Longwall Vibration Analysis**

HEALTH for Longwall Vibration Analysis (former VibraGuard) provides vibration monitoring functionality for longterm health monitoring of the following longwall related equipment:

- CST gearbox and relating motor
- UEL gearbox and relating motor
- Stage loader gearbox and relating motor
- Crusher and relating motor
- Shearer haulage and ranging arm gearboxes
- Water/HFA pump station

## MCU2

### Main Control Unit

#### Application

- Visualization of all longwall data underground at gate end
- Change and control parameter from gate end
- Analysis of longwall system operation and situation
- Provide relevant process and HEALTH data to surface mine control room

#### Features

- Comprehensive software suite (HEALTH for Longwall) serving application software for Roof Support, AFC, Shearer and Plow
- Multi-language support:
  - English, German, Russian, Polish, Czech, Spanish, Chinese
- Robust IPC architecture for reliable operation in hazardous areas
- IS external keyboard with mouse function
- Robust design for sudden Methane face wide power off

### Technical Data

#### Dimensions and Weight

Weight (approximate)	200 kg (441 lb)
Dimensions (approximate):	
Low support cabinet	630 × 945 × 450 mm (24.8 × 37.2 × 17.7 in)
High support cabinet	630 × 1145 × 450 mm (24.8 × 45.1 × 17.7 in)

#### Certifications and Identification

Certification	ATEX (within system: MA and GHOST)
Type of protection	I M2 EEx ib I
Temperature range	−20° C to +60° C (−4° F to +140° F)

#### Electrical Power Supply

- Power supply of the explosion-proof part, 110-240V AC
- Power supply of the intrinsically safe part, 12V DC, maximum 1.5A
- Non-intrinsically safe USB interface

#### Components

Processor	Intel i7 4 . 2.1 GHz
RAM memory	4 GB
Data memory	2 × 120 GB SSD
Hard drive	1 TB 6.4 cm (2.5 in)
Display	48.3 cm (19 in)
Resolution	1280:1024
Operating system	Windows 7
Input equipment keyboard with integrated mouse	

#### Intrinsically Safe Interfaces

- COM 1 BIDI SKK24
- COM 2 BIDI SKK24
- COM 3 BIDI SKK24
- COM 4 BIDI SKK24
- Ethernet via fiber-optic cable 9 μm

Drawings

**MCU2 Dimensions (All dimensions are approximate.)**

<b>A</b>	Width	630 mm	24.80"
<b>B</b>	Height	450 mm	17.72"
<b>C</b>	Length	945 mm	37.20"

## ROOF SUPPORT CARRIERS

### Features

Caterpillar leads the industry in offering customers the most comprehensive line of roof support carriers.

- Capacities from 20 tonnes to 80 tonnes (22 tons to 88 tons) — most often without the need to disassemble large components.
- Length and widths for a variety of entry constraints.
- Safety features that include operators canopy and cab protection, diesel control system, ground level battery access, emergency stops, spring-applied, hydraulic released brakes and optional canopy guarding.
- Diesel and battery powered options.
- Versatile fifth-wheel towing capability with the SH150 trailer.
- Front end work tool options.

## SHIELD TRAILERS

### Features

When used in combination with the CL210 and CL215 LHD machines, the SH150 is the most cost-effective solution for mines that require versatile equipment able to perform multiple tasks. The SH150 shield trailer offers the following features:

- A fifth wheel connection attachment.
- Optional power assist for soft and inconsistent floor conditions.
- Hydraulic raise and lower to facilitate loading and unloading of the cargo.
- Ejection cylinders that facilitate unloading the trailer.
- Spring applied, hydraulic released brake.

### INTRODUCTION

Caterpillar is pleased to offer a comprehensive line up of underground room and pillar products that include continuous miners, haulage, roof bolters, and utility vehicles.

We manufacture these product lines in two locations; Houston, Pennsylvania and Beresfield, Australia. Both are Caterpillar facilities that adhere to the Cat Production System, dedicated to providing our customers with defect-free products of the highest quality.

We currently sell room and pillar products into applications that include coal extraction, gypsum, potash and salt production. In some cases, we purpose build the machine to work in these applications. For potash and very hard coal, we offer a tough cut version of our continuous miner, the CM445. For applications like potash that shy away from water use for dust control we offer oil cooled machines that limit water use. We can offer products that are suitable for both extremely low and tall seams.

For additional digital content for these products, including videos, virtual product tours and animations, please visit the product pages on [www.cat.com](http://www.cat.com).

## CONTINUOUS MINERS

### Features

Caterpillar offers a range of continuous miners that are capable of producing in seam heights as low as 762 mm (28") and as high as 4623 mm (182"). Industry leading power and performance are true across the product line, and in some cases, some products are available with tough cut options for extremely hard cutting. We sell this product line into coal, hard coal, phosphate, gypsum, salt, trona and potash applications.

- Minimum to maximum seam height options that range from 762 mm (28") to 4623 mm (182").
- Conveyor width and depth to max out the production capabilities of the cutter head with components that are designed for long life, reduced stretch and simple maintenance when needed.
- Crawlers that in some cases have new geometry to improve chain life and reduce stretch.
- Radio remote control with self diagnostic capabilities is standard.
- Motor ratings that support both U.S. (60 Hz) and international customers.
- AC tram option available on some models.
- Can be sold as part of a complete Cat system (including feeder breakers, roof bolters, haulage and scoops) supported by both local Cat Dealers and Cat Mining Finance.

**FACE HAULERS****Features**

Caterpillar offers and manufactures the FH120 face hauler from its Houston, Pennsylvania facility. The FH120 is a strong and proven product that is purpose built to withstand the hauling conditions and needs of underground mining. The FH120 Face Hauler offers:

- In by flexibility with battery power.
- A capacity of 17 tonnes (19 tons).
- Quick unloading cycles for fast turns.
- Maneuverability with “True Tracking” where the rear wheels follow in the same track left by the fronts.
- Ride quality improved by the use of accumulators to dampen shock loads.
- Modular design that makes service straight forward and provides greater accessibility.
- Efficient use of energy providing long battery discharge life.
- Safety features include tape-switch emergency stops, automatic emergency brakes, operator’s protective canopy, and dry-chemical fire suppression.

## CONTINUOUS HAULAGE SYSTEM

Continuous Haulage can be tailored for your specific projection, and can be easily installed in new or existing operations. They are as reliable and trouble-free as any piece of face equipment available today.

### Features

- Up to 18 tonne-per minute (20 ton-per-minute) capacity.
- Attached or detached systems (with hopper).
- 0.8 m (30 in) conveyor width.
- Internal gear-driven crawler drive assemblies.
- Forged 0.4 m (14 in) crawlers are designed to provide a balance between tractive ability and yet maintain low ground pressures in soft conditions.
- Available with an optional feeder breaker to size material.
- On board electronics provide diagnosis capability on over 400 events — operators get both a code and words to describe the event.
- Optional spray manifolds can be added for dust control.
- Safety features include “man in position” sensors, operators protective canopy, and e-stops.
- Remote grease points are easily accessible.
- Lighting for excellent work area visibility.
- Chromium carbide overlay plate is used on the conveyor to control wear and provide long service life.
- Torque limiter couplings on conveyor drives protect against spikes and chain breakage.
- Simple hydraulic system with excellent filtration to maintain performance.

## FEEDER BREAKERS

More than 1000 Cat feeder breakers are enabling productivity and profitability on mine sites around the world. Heavy-duty frame construction, high tractive effort and the ability to have the tail piece integrated into the main frame make our feeder breakers the perfect fit for longwall development sections.

## Features

- Mid and High Seam options available.
- High pick forces and processing rates make these very productive machines.
- Unique spiral-pick breaker bar for hard rock and pyrite balls.
- Heavy duty crawler design providing stability and tractive effort.
- Mechanical conveyor drive standard with optional hydraulic drive available.
- Chrome carbide overlay on conveyor pans for extra long life and wear resistance.
- Torque limiting on conveyor to safeguard against torque spikes and stoppages caused by debris.
- Multiple intake configurations to fit face haulage equipment.

**ROOF BOLTER**

Caterpillar offers a single roof bolter model, the RB220. This dual boom model is a proven, hard working and well designed product that's simple to operate, simple to maintain and will provide many years of service.

**Features**

- Articulated steering for maneuvering.
- Both horizontal and vertical articulation on this dual boom model.
- Floor and roof avoidance compensation.
- Individual planetary wheel drives — no sprockets or chains.
- User-friendly operator zones.
- Single AC primary drive motor.
- Single hydraulic oil pump.
- Easy access components.
- Quick free-steering towing conversion.
- Streamlined, practical space-planned tram station.
- Safety features include ATRS system, tape-switch emergency stops, automatic emergency brakes, operator's protective canopy, and dry-chemical fire suppression.

<b>MODEL</b>	<b>RB220</b>

## SCOOPS

With over 40 years of experience and over 6500 battery-powered units produced, Cat scoops are leaders in the industry. These products set the bar for efficient and reliable underground utility vehicles. The SU488 is one of the strongest and most rugged low-profile scoops ever built.

## Features

- Oversize center sections for long life and reliability.
- Safety features include tape-switch emergency stops, automatic emergency brakes, operator's protective canopy, and dry-chemical fire suppression.
- Wet-disc service brakes.
- Proprietary IGBT electric controllers.
- Multi-purpose contoured bottom bucket.
- Planetary wheel drives.
- Ground-level battery change system.
- Optional AC traction.

**LHD VEHICLES (LOAD-HAUL-DUMPS)****Features**

Cat Load Haul Dump machines are equipped to handle all types of utility work in close, underground applications. With work tool versatility and quick disconnect and rapid attachment features, work gets done quickly and efficiently.

With three diesel powered models to choose from, your utility needs can be met with options that include wet or dry type exhaust systems, heavy duty axles, and varying lift and power capabilities.

- Rapid Attachments System (RAS).
- Turbocharged, aftercooled, diesel engine with 4-speed transmission with manual or electronic push-button powershift with forward/reverse mode.
- Wet bath or dry type exhaust system with diesel particulate filtration.
- Optional OEM heavy-duty axles with spring applied, hydraulically released brakes.

## INTRODUCTION

An increasing volume of refuse is generated by every person, household, commercial and industrial, entity day after day ... 365 days a year. Disposal of this waste is a major concern worldwide. Increased governmental regulations designed to protect the environment along with rising transportation and land acquisition costs dictate that customers need to be cost conscience. Waste applications are very demanding and are a significant user of earthmoving and specialty mobile equipment, parts, and service. Caterpillar has Waste Specialists in each of the below categories. If you have questions, please contact your local dealer, Waste representative, or go to *Cat.com*.

## SAFETY

Waste industry operators work in some of the world's harshest conditions, so Caterpillar has developed a range of safety resources to help your organization build a culture that delivers everyone SAFELY HOME. EVERYONE. EVERYDAY.™ Caterpillar Safety Services offers training programs, safety checklists, Toolbox Talks, videos, virtual walk arounds and other resources specific to the waste industry at *safety.cat.com*. Click on the Industry Safety tab, and then select Waste.

## OVERVIEW

Waste applications are some of the harshest environments that machines and operators will work in. By definition waste is any discarded, rejected, abandoned, unwanted or surplus material.

The Waste Stream — It is important to understand the type of material you are working with when trying to spec a work tool and machine. Through many site assessments and machine productivity/competitive testing, we have found one underlying theme, the type of waste stream and site conditions, will dictate the type of work, tool, and machine. Residential waste (MSW), construction and demolition (C&D), green waste, commercial waste, wet waste\*, industrials and sludges, auto fluff/car shred, etc., are just some of the types of waste that are dealt with daily. Each type of waste has different characteristics and properties. Weights of these materials could be as low as 148 kg/m<sup>3</sup> (250 lb/yd<sup>3</sup>) to over 1187 kg/m<sup>3</sup> (2000 lb/yd<sup>3</sup>) (sludges and soils). For example, during a recovering/recycling application, your work tool **Fill Factor** could be as high as **150–200%** when dealing with some MSW and shredded C&D.

## MATERIAL RECOVERY FACILITIES, SORTING, AND TRANSFER STATIONS

### Safety

MRF's, Sorting and Transfer Stations are not only harsh but busy environments. Inbound loads, mobile equipment, tip floor personnel, and outbound loads, are only a part of the traffic and dynamics dealt with minute by minute in very close settings. Proper PPE (personal protective equipment) for people, guarding for machines, and safety equipment on machines, are essential to keep safe.

### Technology

Due to the demanding type of applications within MRF's, Sorting and Transfer Stations, machine technology has to lead the way in offering the ability to: scale loads, manage fuel and machine utilization, keep tire wear to a minimum, and help the operator with visual safety front and rear. Eco Modes on machines allow the ability to switch to a fuel saving mode. Product Link™ helps with tracking fuel burn, machine idle time and utilization. Traction control enables the operator to keep tire wear to a minimum.

### Overview: Changing Attitudes in Waste Applications

MRF's (material recovery facilities) sorting, and transfer stations are becoming an important part of the waste industry. Diversion of waste from landfills is a global trend. The European Union, (EU), Canada, Japan, are just a few of the countries who divert 50–75% of their waste stream away from landfills. Cardboard, plastics, paper, food and green wastes are recovered, recycled, or composted. Major changes in the waste stream dictate different methods to gain density. The old mantra of "4–5 passes is enough," now becomes 4–7 passes so that materials can be shredded and bound together for higher densities. The U.S.A. is following this trend as regulations become stricter and the costs of siting/building landfills become higher. Transfer stations become a necessity as disposal sites continue to decline and/or move further away from city centers. MRF's, Sorting/Recycling and Transfer Stations all help reduce primary road and landfill traffic which helps create a safer environment for all.

\*Wet Waste — Several country's, regions, and areas globally have concerns with waste that has a high moisture content. If you or your customer are working with a 'higher moisture content' type of waste, please see the *Wet Waste* section under *Landfills — Types of Waste and Refuse Densities*.

**Primary Roles**

- MRF's (Material Recovery Facilities) Sorting and Recycling Stations are designed to divert recyclable materials from the waste stream. Depending on whether the material is single stream, co-mingled, or pre-sorted, the goal is to divert recyclable material for re-consumption thus lowering the amount of waste placed in a landfill. The natural life of the landfill will be extended by this action. Additional savings of hauling costs can be realized by recovering/recycling materials close to the source (at the MRF or Transfer Station).
- Transfer stations, are designed to consolidate the loads of several residential vehicles in to long-haul vehicles such as rail cars, transfer trailers, barges, and ISO containers. On an average 2–5 inbound loads or more (depending on method of haul) can be consolidated into one outbound load. As a result, transfer stations offer cost savings over direct haul to landfills.

**MRF's (Material Recovery Facilities),  
Sorting Stations, Recycling Stations**

A well-coordinated recycling program will reduce volume going to the landfill by 50% or more. Trends are towards sorting and 1 of 2 types of MRF's.

- Dirty MRF — A dirty MRF accepts mixed waste, (normal household waste that has not been separated) that later may be sorted for recycling. Recoverable/recyclable materials are sorted either by hand or automation or a combination of the two. The materials are either baled and/or are hauled to a plant/industry that will utilize the recovered goods.
- Clean MRF — A clean MRF accepts source separated materials from residential or commercial sources. These are normally delivered in separate collection vehicles. As in the 'dirty' MRF, materials are either sorted by hand, automation, or a combination of both, baled and/or are taken to someplace that will recycle or utilize the recovered goods.
- Sorting Stations — Some transfer stations are designed for some waste diversion from mixed streams and are normally described as 'sorting stations.'

**MRF's, Sorting and Transfer Stations Applications**

There is a wide range of variability in MRF, Sorting and Transfer Station applications and operations. Depending on facility size, amount of material handled, type of station, etc. a wide variety of mobile equipment could be utilized.

In all the facilities mentioned above, materials are tipped by residential or commercial vehicles on to a tip platform or tip floor area. The materials are stockpiled then loaded into hoppers, conveyors, or a haul vehicle. Wheel loaders and excavators (tracked or wheeled) are the primary equipment for stockpiling, loading, sorting, topping off loads, and 'tamping' material into the haul vehicles.

"Volumetric consolidation of material" (normally in Transfer Station applications) is a method of compression and shredding that helps reduce the size of the waste loaded into a haul vehicle. It helps maximize the allowable weight carried by each haul unit. Common machines used for material consolidation are, track-type tractors, track loaders and compactors. These machines are equipped with track shoes or tips/teeth that help in shredding, compression, and reduction of the volume of waste. In most instances, machines performing the material consolidation/reduction are aided by a wheel loader or excavator.

For all applications within MRF's, Sorting, Recycling, and Transfer Stations, there is normally support equipment aiding the primary equipment. Small and compact loaders and excavators, backhoe loaders, skid steer loaders, and fork lifts, are just a few of these machines being utilized.

### **Types of Transfer Stations**

Globally, top loading and compaction transfer stations are the two most popular designs. There are many different types of transfer stations, but, most conform to these two designs.

Top loading systems are the most common and simplest to operate. In top loading designs, there are normally five types of loading arrangements: direct, surge pit, full separation, half separation, and same level or floor loading. Depending on the type of transfer station, wheel loaders, excavators (tracked or wheeled), dozers, track loaders, and compactors can be utilized alone or in systems providing quick efficient waste handling.

Compaction transfer stations utilize hydraulic compaction equipment prior to or during the loading of the haul vehicle to compress the material into bales/logs or into the haul vehicle itself. The hydraulic compactor can be top loaded or side loaded by wheel loaders or excavators, depending on the type of design.

### **EQUIPMENT SELECTION**

In waste applications, the largest single cost in daily operations is purchasing, operating, and maintaining the equipment that will handle the waste. Undersized, inadequate, or unreliable equipment results in inefficient operation and higher maintenance and fuel costs. As in many Cat® applications/industries, right sizing equipment should follow the familiar path of; Task, Tool, Machine. **TASK:** Understand the task or application the machine will work in. **TOOL:** What tool or tools will aid the machine in performing the task most efficiently? **MACHINE:** After finding the 'right tool(s)' to perform the job, then match it to the right sized machine.

Equipment in MRF, Sorting and Transfer Station applications perform the below operations.

1. **Stockpiling the Waste.** Once it is dumped onto the tip floor, wheel loaders, wheeled or tracked excavators, track-type tractors, track loaders, or compactors will push the material up into a stockpile. Stockpiling helps: recover storage and working space within the building, get the waste slightly denser, store the waste till it can be processed or loaded.

Factors for a machine in stockpiling are: type of tool, reach, lift, ceiling height, storage space, and maneuverability.

2. **Recovering and Sorting.** Waste streams are rich in recoverable/recyclable materials. Waste diversion or recovery not only helps reduce the amount of waste going to landfills, but adds to profitability when sold to commodity markets. Sorting and recovery prior to stockpiling or loading can be accomplished with specialized machines equipped with sorting grabs, grapple buckets, or grapples. Stockpiled materials are sorted prior to loading or when loaded with grapples or grapple buckets. All sizes of equipment could be used depending on type of material and material flow. Compact wheel loaders/excavators, skid steer loaders, backhoe loaders, medium wheel loaders and excavators, and telehandlers should be sized according to amount of waste and type of application and type of tool(s) needed. It should be noted that in this type of application couplers on primary and support equipment could be a necessity.
3. **Loading the Waste.** No matter what type of haul/load out, vehicle/conveyor or hopper, materials are either pushed, load and carried, grappled or bucket loaded into transport vehicles or containers. Wheel loaders, tracked or wheeled excavators, track-type tractors, track loaders, compactors or any combination of these (systems) can be utilized. Note that the type of loading application will dictate the type of tool and machine necessary for optimum efficiency in the loading process.
4. **Reducing Volume of Material.** Haul vehicles/transport vehicles need to leave with the maximum allowable weight for the type of transportation mode being used. Wheel loaders and tracked or wheeled excavators can keep stockpiling or turning the waste to get the waste more dense. However, best compression, shredding and volume reduction of the waste is seen by layering waste in thin layers, continuous running over (passes) the waste, turning the waste, and "working" the waste. Track-type tractors, track loaders, and compactors normally see an average of about 60–120 kg/m<sup>3</sup> (100–200 lb/yd<sup>3</sup>) higher density than wheel loaders or excavators in this type of application. Type of track or wheel/tip design is very important for shredding and compression in this type of application.

5. **Support Equipment.** Primary equipment often are supported by machines performing; clean up and sorting with specialized work tools, sweeping with brooms, stacking and loading with pallet forks or bale clamps, etc. Compact wheel loaders and excavators, backhoe loaders, skid steer loaders, and telehandlers equipped specifically for the tasks they need to perform can increase production and efficiency in all areas. Most of the time one or two machines are equipped with couplers to increase their versatility and efficiency helping lower costs.

### Machine Selection Factors

Parameters that could influence tool and machine size, quantity, and possible combinations of machines in MRF's, Sorting and Transfer Stations could include:

1. Amount and type of daily waste to be handled (daily tonnage). During daily inbound tonnage, some peak delivery times occur. It has been found that approximately 50%–60% of inbound tonnages occur on 2–3 “Peak” hours/times of the day. Depending on the inbound tonnage during these times, machines could be spec'd towards these peak times (type and size of facility). What loading platform (top loading/compaction facilities) are they using and how much overall space to work in.
2. Facility load out dynamics.
  - a. Maneuverability
  - b. Ceiling height
  - c. Floor size/storage space
  - d. Floor arrangements
  - e. Type of load out (below grade, ½ separation, same level, surge pit — loading)
  - f. Haul unit specifications
  - g. Inbound/outbound traffic patterns
3. Requirements for volume reduction for higher tonnages in load out.
4. Supplemental tasks performed in daily operations.
5. Budget.
6. Future growth.

**NOTE:** Waste applications place high demands on machinery requiring protection of the machine and its components. Special guarding is needed on all moving parts like axles and drive shafts. Windshields, fuel and hydraulic tanks, radiators, hoses, engine enclosures, are all vulnerable to debris and damage and require guarding. Specially designed debris screens and radiators will ensure clean out and better heat transfer for more efficiency.

### Wheel Loaders

Wheel loaders are normally the primary machine used in MRF's, Sorting and Transfer Stations. Wheel loaders are designed, guarded and built in factory to withstand these harsh environments. Primary operations include: sorting and recovery of materials, push and stockpiling of waste, cleaning floors, support work, and loading conveyors/hoppers/and outbound haul vehicles. Depending on type of material, reach needed, amount of sorting required, ceiling height, floor wear, and type of load out, the machines can be equipped with a wide variety of buckets, attachments and tires. Keeping the thought process of Task, Tool, Machine in mind, a good knowledge of the facility, its waste stream, and type of support work, is needed to ‘right size’ the wheel loader(s) for these applications.

- Compact Wheel Loaders (906–908) — Normally used in small tonnage MRF's/Sorting Stations or as support in larger stations, maneuverability and versatility (coupler equipped) are its main strengths.
- Small Wheel Loaders (924–938) — Used in small–medium MRF's, Sorting and Transfer Stations and as support in larger stations, the small wheel loader brings maneuverability and versatility (coupler equipped) to these types of applications.
- Medium Wheel Loaders (950, 962, 966, 972, 980) — When larger tasks, better reach, higher stockpiling, larger tonnages, etc. are needed, a medium sized wheel loader is normally utilized. These machines have excellent weight to horsepower ratio for better traction and moving larger loads.

The following Wheel Loader Operating Recommendations Chart is an estimate of possible machine(s) for tonnages and type of facility. (Note: Keep in mind the task/application the machine will work in, what tool(s) might accomplish the tasks and then size the machine.)

**Wheel Loader Operating Recommendations**

Tons per Day Volume	Clean MRF Recovery/Recycling	Dirty MRF/Sorting Station	Waste Transfer Station	C&D MRF	C&D Transfer Station
<b>0-100</b>	906-930	924-930	924-930	930-950	930-950 <sup>b</sup>
<b>100-350</b>	908-930 <sup>a</sup>	924-930 <sup>a</sup>	924-938 <sup>a</sup>	950-966 <sup>d*</sup>	950-966 <sup>d*</sup>
<b>350-500</b>	930-950	930-950 <sup>*</sup>	938-966 <sup>*</sup>	966-980 <sup>a*</sup>	950-966 <sup>d*</sup>
<b>500-1000</b>	930-950 <sup>**</sup>	938-950 <sup>e*</sup>	950-966 <sup>**</sup>	966-980 <sup>*</sup>	950-980 <sup>d*</sup>
<b>1000-1500</b>	938-950 <sup>**</sup>	938-966 <sup>e*</sup>	966-980 <sup>**</sup>	950-980 <sup>d,e*</sup>	966-980 <sup>d,e*</sup>

C&D = Construction and Demolition

\*Depending on inbound/outbound tonnage, reach, production required, this machine could step up to either a 962 or 972.

- a = Multiple machines recommended (contact your local Cat dealership for recommendations)
- b = Depends on type and density of C&D material
- c = Waste stream mixture may require multiple machines
- d = Operating hours may require additional machines
- e = Multiple machines required

The above are rule of thumb estimates. Your application might vary enough to change the machine for the above recommendations.

Other questions that might need answered are:

- What are you loading? Conveyors, haul vehicles, hoppers, etc.?
- If loading conveyors or drums — what are the feed capacities, FPS rate?
- How much storage capability in your building?
- What type of loading are you performing?
- How much reach is required for stockpiling and loading?
- “Other” required operations that the machine might perform?

**Additional Considerations**

All facilities are different and require special considerations when ordering and specifying tools and equipment. If tonnage and operating hours change, then tool and machine might change. Machine weight has to balance power to ground for best traction on slick floors. Keep in mind Task, Tool, Machine. (What type of work will the machine be asked to perform during the shift? What tool(s) will apply to that type of work cycle? What machine fits to that type of tool?)

It should be noted that most of the wheel loaders being sold into MRF, Sorting and Transfer Stations are high lift. This arrangement offers increased reach and lift height not only for loading and stockpiling, but in case the haul vehicle has to be brought to the same level as the machine to be loaded.

### Hydraulic Excavators (Tracked and Wheeled)

Hydraulic excavators (tracked and wheeled) are often found in MRF, Sorting and Transfer stations either as a primary or secondary tool for loading haul vehicles/conveyors/hoppers, tamping and finishing off loads, and sorting materials. Fast cycle times are the primary advantage of an Excavator over a Wheel Loader. Wheeled excavators come with a maneuverability advantage especially in tight loading and stockpiling areas. Depending on the type of application, tracked and wheeled excavators would be equipped either for high production loading/compaction, or with sorting/separating tools for recovery of recyclable materials.

Again, keeping the Task, Tool, Machine concept in mind, you should take into account the following when sizing a tracked or wheeled excavator. Type of material and density, tonnage, work load for the machine, ceiling height, work area/swing area, floor size, along with maneuverability needed, ability to 'see' into haul vehicles or down into the floor load out area (cab risers), and reach. Special guarding packages, radiators, and reversing fans are options that may be needed to meet the most demanding needs.

### Track-Type Tractors

Waste Handling Track-Type Tractors are designed, guarded, and built in factory so that they can accommodate all waste applications. Although its primary use is for pushing and layering the waste and cover materials in landfills they offer alternative waste movement and volume reduction in large transfer stations and C&D transfer stations. Ex: In surge pit operations where waste is tipped into a level below the tipping floor. Track-type tractors will push, layer, and compress/shred the material during operations and push into a haul vehicle. This method is used when maximum volume reduction is required or peak rate of waste exceeds available floor space.

### Track Loaders

Waste Handling Track Loaders are designed, guarded, and built in factory so that they can accommodate all waste applications. Transfer stations are a strength for this machine due to its versatility in this application. Sorting, pushing, layering, and compaction are all part of typical operations within the transfer station application. Just like the track-type tractor, the track loader is used in higher tonnage transfer stations, C&D transfer stations, and when waste needs volume reduction. Equipped with a multi-purpose bucket, the track loader can sort, push, layer, compress and shred, and load material into outbound haul vehicles.

### Landfill Compactors

Although landfill compactors are designed for spreading and compacting large volumes of material in a landfill environment, in some instances, transfer stations might have a large enough working area to allow the compactor to be utilized to reduce waste volume prior to loading into haul vehicles. They offer two advantages in this type of application.

1. They are configured and guarded to work in this type of environment.
2. They achieve higher compression, shredding, and compaction levels compared to other machines.

**CAUTION!** Operating a landfill compactor, track-type tractor, or track loader on a concrete floor could be counterproductive due to floor wear and maintenance costs. Always keep a layer of waste between the floor and machine until final movement of the day. Wheel loaders and/or excavators (wheeled/tracked) should be used to support these machines. (Please see #4 under previous Equipment Selection.) (It is not recommended to use a landfill compactor larger than the 826.)

### Work Tools for Material Recovery Facilities, Sorting and Transfer Stations

As described in the opening statements of this section, the waste stream can consist of many different types of materials sometimes all blended together. For that reason, work tools become a very important part of moving, sorting, and dozing in waste applications.

At the end of this section, there will be a Work Tool section and chart discussing possible tools to use. Please contact your dealer/regional waste representative for more information.

**LANDFILLS****Safety**

Landfills are harsh and busy environments. A variety of vehicle traffic on haul roads, busy tipping areas, people on the tip floor, a large variety of different types of waste, mobile heavy equipment operations, special waste haulers, etc. are all part of the dynamics of a landfill working face. Proper PPE (personal protective equipment) for people, guarding for machines, proper training, and safety equipment on machines, are essential for a safe work environment.

**Technology**

Due to the demanding environment and its possible applications, machine technology has to lead the way in offering the ability to: manage fuel and machine utilization, keep undercarriage cost to a minimum, and help the operator with visual safety front and rear. Eco Modes on machines allow the ability to switch to a fuel saving mode. Product Link helps with tracking fuel burn, machine idle time and utilization. Computers, VIMS™ (Vital Information Management Systems,) and Traction Control (in some track-type tractors) helps operators control spin and keep track of mileage to help decrease undercarriage wear.

**Landfill Overview: Landfilling Now and in the Future**

Although recovering and recycling materials is becoming more prevalent, landfilling still provides a place to deposit waste materials or refuse not able to be recovered/recycled. A landfill protects the environment by disposing of the waste in an engineered cell. Siting, designing, building, and operating a landfill is costly. Depending on country, state, region, etc., landfills have to design and operate to very strict regulations. Proper equipment selection and daily operating techniques can maximize and extend the operational life of the landfill along with lowering costs.

Primary types of landfills are MSW (municipal solid waste/residential), C&D (construction and demolition), and Hazardous (hazardous industrial sludges, asbestos, etc.) with the majority of landfills being MSW or residential waste. Landfills can take in many different types of materials and will range from less than 90 metric tons/day (100 tons/day) to over 13 610 metric tons/day (15,000 tons/day). Depending on the country you live in and its regulations on recycling, the waste stream going to the landfill could be a mix of food wastes, packaging, plastics, cardboard/paper, metals, C&D, etc. In some highly regulated countries, food wastes, plastics, cardboard/paper, metals, and C&D, are diverted to C&D landfills, composting sites, and/or facilities that will recycle the recovered product.

In keeping with environmental concerns, most landfills have a highly engineered method of dealing with leachate, gas, and inbound waste. (See the *Caterpillar Equipment and Application Guide — Waste Landfills* or your countries Environmental Landfill sites.) Once cell, leachate, and gas methane extraction development are in place, the basics are to: push, layer, compact the waste in thin layers, adding daily cover or ADC (alternative daily cover) sparingly. The idea is to fill the landfill with as much waste as possible without robbing airspace by using too much cover soil.

Future. Diversion rates of recoverable materials within the EU Canada, some Asia Pacific countries, and starting in the U.S. will eventually reach 60%–80% diversion or more. This will all depend upon commodity markets and the demand for the recycled materials. It also drastically changes the waste stream going to the landfill. The type of waste going to a landfill from a good diversion plan is normally light plastics, packaging, hard to handle materials, metals and materials that can't be recycled. This waste stream might require different handling, processing, amount of passes, and compaction techniques to shred and compress it as much as possible and possibly different wheel tips and tip patterns. (See text in *Factors Governing Compaction —Developing a Pattern and Running Proper Passes.*)

## EQUIPMENT SELECTION

A landfill's largest single cost for daily operations is purchasing, operating, and maintaining its mobile equipment fleet. Undersized, inadequate or unreliable equipment results in low machine utilization, higher fuel and maintenance costs and eventually improper landfill operations.

Landfill equipment performs three major distinct functions:

1. **Waste disposal:** Which includes, pushing, spreading, and compaction. Track-type tractors, track loaders, and landfill compactors are primary machines in this application.
2. **Cover material mining and application:** Machines will provide daily cover requirements whether cover soil or ADC (alternative daily cover). If supplying cover material is a machine's sole function, then it can be selected on the same criteria as normal earthmoving. Distance to borrow pit, material characteristics, volume to transport, production needs, underfoot conditions, etc. are all important in right sizing the equipment. Lowest cost is determined by best efficiency and lowest cost/m<sup>3</sup> (yd<sup>3</sup>).
3. **Support activities:** What 'other' roles might the equipment be asked to accomplish or what support is needed for the primary equipment? Water trucks to keep dust down, motor graders to maintain haul roads, wheel loaders/excavators/backhoes/skid steer loaders, telehandlers, etc., with couplers that can utilize all types of work tools, generators, service vehicles, air compressors, etc. are all necessary equipment to keep the landfill running efficiently.
4. **Peak periods:** Most landfills have to deal with 2–4 periods during the day where more volume of waste is delivered by more inbound vehicles than normal. These are called peak periods. Depending on the size of the landfill and amount of peak waste coming in, it should be noted that some landfill equipment can or should be specified in order to handle these peak times of waste and vehicles.

There are many variables when choosing the "right" sized equipment for landfill use. Again, we point to the direction of thinking: Task, Tool, and Machine. What are the application, production, compaction, support requirements? What tool or tools can accomplish this task? And finally, what machine(s) will handle the tool(s) most efficiently? (To help with 'right sizing' a compactor and/or track-type tractor together, Waste Fleet Analysis/WFA (downloaded at *Dealer.Cat.com*) can be utilized as a rule of thumb to determine possible compactors/track-type tractors and combinations of the two.)

### Track-Type Tractors

Waste Handling Track-Type Tractors are designed, guarded, and built in factory so that they can accommodate all waste applications. The track-type tractor is the most popular machine on the landfill. They prepare the site, build haul roads, push/spread/and sometimes compact the refuse, spread cover material, and perform a variety of support functions. Quantity of material to be moved/hr., type of inbound delivery vehicles, distance of push, support work needed, etc., all should be taken into consideration when sizing a track-type tractor for its application. Economic distances for dozing waste or cover soil efficiently is no more than 90 m (300 ft) or less. The track-type tractor, when used to compact, can achieve densities of approximately 475–590 kg/m<sup>3</sup> (800–1000 lb/yd<sup>3</sup>) (MSW, 3:1 or less slope, multiple passes).

### Track Loaders

Waste Handling Track Loaders are designed, guarded, and built in factory so that they can accommodate all waste applications. These machines are highly versatile and perform many primary and support activities. They can be used in any size landfill and are ideal for landfills under 135 metric tons (150 tons) since they can work solo to perform waste handling and cover material functions. Equipping the machine with a coupler or a multi-purpose bucket increases its versatility. The multi-purpose bucket can be used for pushing waste, sorting materials, and dozing cover soils. The machine can be equipped with different track options from double to single grouser allowing it to work in normal operations or be utilized to more aggressively shred materials (Heavy MSW or C&D). Utilizing correct methods of compaction, (spread thin and load the bucket with soils to increase weight) will achieve higher densities during compaction. Compaction densities can range from 475–590 kg/m<sup>3</sup> (800–1000 lb/yd<sup>3</sup>).

**Landfill Compactors**

Landfill Compactors are specifically designed, built, and guarded in the factory to effectively shred and compress large volumes of waste. Depending on landfill size and amount of tons inbound daily, the compactor will work solo (pushing, spreading, compacting) handling all the inbound waste, or work in tandem with a track-type tractor (track-type tractor — push/spread, compactor — shred/compact). When working the track-type tractor and landfill compactor together as a “system,” productivity and compaction densities will increase. Depending on the type of waste stream to be compacted, initial waste density, depth of the layer spread, and size/weight of the landfill compactor, compaction densities can be 593–1100 kg/m<sup>3</sup> (1000–1854 lb/yd<sup>3</sup>). Although the compactor can work on steeper slopes, best slopes for highest density for landfill compactors are 4:1 or less.

**Wheel Loaders**

Wheel loaders are designed, guarded and built in factory to withstand these harsh environments. Not recommended as a compaction machine, wheel loaders are mobile and versatile and sometimes are used by communities sharing a single machine which can travel and support community/landfill projects. Wheel loaders are normally equipped with a coupler and many different tools to make it more versatile. Loading cover soils, sorting, clean up, spreading road material, and handling leachate/gas pipes are just a few of the activities wheel loaders perform in landfill applications.

**Hydraulic Excavators (Tracked/Wheeled)**

Every landfill has a tracked or wheeled excavator supporting its operations. Whether equipped with a coupler, which accommodates multiple tools, or a pinned attachment, wheeled and tracked excavators offer superior versatility in: cell development, cover soil mining, ditch/pond clean out, and leachate and gas extraction support. Wheeled excavators give you mobility and maneuverability along with the ability to be able to respond quickly to support needs. When loading cover materials is the primary application, it is critical to know the size of the haul vehicle, type of material, and production required, so as to define the proper size bucket, stick, and finally machine to meet production needs.

**Wheel Tractor-Scrapers**

Wheel tractor-scrappers mainly perform cover soil operations. Wheel tractor-scrappers work in site preparation, cell construction and hauling/placing cover material. When underfoot conditions are good and the haul over 185 m (600 ft) the wheel tractor-scraper will be economical. The machine should be selected as if performing a typical earthmoving application. Average sized landfills prefer the work alone capability of either an elevating or twin engine scraper since they are self-loading machines. Larger landfills sometimes utilize larger push-pull scraper units to meet their daily cover soil production needs. Preferably, the scraper unloads the cover material close to the working face where track-type tractors or track loaders can push and spread the material in the required layer depth. This will reduce tire damage and extra maintenance costs to the machine.

**Articulated Trucks**

Articulated trucks are versatile, highly maneuverable, all weather haulers that can negotiate poor underfoot conditions. Like wheel tractor-scrappers, articulated trucks work in site preparation, cell construction, and hauling/placing cover material. Articulated trucks are normally loaded by a variety of loading tools and economically effective with hauls from 0.2 km–5 km (600 ft–3 miles). In dump configuration, cover material is dumped close to the work face and spread by a supporting track-type tractor or track loader. Ejector configured trucks are preferred and provide safer on-the-go dumping in normal to softer more sloped ground conditions where a “dump configuration” machine would not be suitable. Cat articulated trucks offer optional container handling and refuse body configurations for specialized landfill applications.

**Work Tools for Working in  
Waste Landfill Applications**

As described in the opening statements of this section, the waste stream can consist of many different types of materials sometimes all blended together. For that reason, work tools become a very important part of moving, sorting, and dozing in waste applications.

At the end of this section, there will be a Work Tool section and chart discussing possible tools to use. Please contact your dealer/regional waste representative for more information.

### Machine Selection Factors

Selecting the type, size, quantity, and combination of machines required to spread, compact, and cover varying daily refuse volumes is determined by the following parameters:

1. Amount and type of waste to be handled (daily tonnage) (peak periods should be charted and reviewed and taken into considerations)
  2. Amount and type of cover material to be handled
  3. Distance cover material to be transported
  4. Compaction/density requirements
  5. Weather conditions
  6. Supplemental tasks
  7. Budget
  8. Growth
- A. Daily tonnage and peak periods — Amount of waste produced by a community is the major variable in selecting the appropriate sized machine. The following chart serves as a “guideline” in sizing a landfill machine. For example, if a community generates approximately 180 metric tons (200 tons) of refuse per day, a D6, 953, and/or an 816F2 landfill compactor could be considered. Depending on the tonnage, type of waste, and peak periods, multiple machines or a ‘system’ of machines (ex: 836K and D8T) could be considered. As discussed earlier, peak periods during the day, (periods of time where a higher than normal average amount of waste comes in) could dictate what size machine is needed to keep up with the inbound waste. During these times, another machine could be added to the mix until the waste is layered and compacted correctly.
- B. Amount and type of cover material to be handled — Landfill, size, type, and methods of operation vary dramatically from site to site. The type and amount of cover material utilized is important. The use of Alternative Daily Cover (ADC) is highly recommended to reduce loss of valuable airspace. Landfill managers track cover material use as close as they track their airspace and maintenance. The use of cover material is broken down into three segments: daily, intermediate, and final. Landfill operators agree that daily cover should be no more than 10% or less of the entire lift. No matter how much daily or intermediate cover is used, the growing trend is to remove or ‘mine’ cover material prior to beginning the daily operation in that area. The total combination of daily and intermediate cover if not removed, could end up being more than 25%–35% of total landfill airspace loss. Removal of cover material increases airspace and helps facilitate leachate and gas migration.

Blade/bucket design is paramount if a machine is used specifically for working with cover soil. Straight blades, Semi U blades, and multi-purpose buckets are primarily used by track-type tractors and track loaders. With the need to carry and layer cover material to an exacting maximum, blades/buckets that can shed material easily are recommended. If the machine will be used in waste and cover soil operations, then a Semi Universal blade (for load and carry) and the multi-purpose bucket are good recommendations.

- C. Distance cover material is to be transported — Whether working with daily, intermediate, or final cover, the following guidelines are recommended for cover material movement. Quantity of material to be moved, required production, and maintenance results, must also be considered when using these guidelines.

Track-type tractor	0-61 m (0-200 ft)
Track loader	
Push/spread	0-61 m (0-200 ft)
Load & Carry/spread	0-150 m (0-500 ft)
	(Type of material/application needs to be considered for possible excessive track wear)
Wheel loader	0-185 m (0-600 ft)
Wheel tractor-scraper	over 185 m (over 600 ft)
Articulated truck	over 185 m (over 600 ft)
	(Haul distance, road and borrow pit conditions, weather, tip area dynamics — all need to be taken into consideration when making a decision to use a scraper or articulated truck)

- D. Compaction requirements — Best utilization of airspace is critical to extending landfill life. Quantity and type of material, work face variables, operator skill, operating hours, size and type of equipment, etc., all play a part in achieving high densities. Highest density is gained by utilizing a ‘system’ approach of machines (track-type tractor pushing and spreading — compactor leveling and compacting) or to a lesser extent, just using a compactor.

The following product segments of this section will contain features, specifications, and work tools for primary Cat Waste Handling machines. Additional drawbar/rim-pull vs. groundspeed charts, ground pressures, controls, production estimating tools, information, can be found in respective product sections within this *Performance Handbook*.

The below *Machine Tonnage and Usage Selection Factor Guide* should be considered a ‘rule of thumb.’

To use; find the amount of tonnage/day that the landfill takes in (left column) — to the right of that column find the possible machines that could be used for that amount of tonnage (marked by an ×). Please note that depending on the type of waste, amount of waste/day, and even amount of waste/hr., a single machine could be utilized or multiple machines might be necessary.

*For example:* Follow the left column down to 45.3 to 136 Metric Tons/day (50 to 150 tons per day) — For MSW Landfills — All the machines marked by ×’s could be utilized. Smaller machines for smaller tonnages, larger machines for larger tonnages. Depending on budget and required density, and required support activity, a single machine might be used or a combination of machines could be needed.

**TYPE OF WASTE AND REFUSE DENSITIES**

The type and density of the waste stream inbound to MRF’s, Sorting/Transfer Stations, and Landfills determine how it is handled, the type of work tool, and ultimately the type of machine to handle it. Type of waste to be handled will strongly influence machine selection. The major waste components for the community and landfill should be identified and machine selection based on the type of waste and compaction density required. For example, if the site receives a high proportion of material that is hard to compact like medium to heavy C&D waste, (rocks, bricks, concrete, tree stumps, telephone poles, etc.) a landfill compactor might have a hard time achieving normal densities without the help of a track-type tractor or track loader. Tracked machines have more difficulty pushing and compacting bulk waste such as trees, road materials, iron, etc. A combination or “system” of both tracked machine and landfill compactor might work best. Depending on the type of waste, different tip/cleat designs will help with shredding, traction, and density.

On average, Americans generate approximately 2 kg (4.4 lb) waste/day while the European Union (EU) generates about 1.4 kg (3.0 lb) waste/day. (Before recovery/recycling) Waste composition varies from location to location, the following charts are representative of the waste stream in the U.S. and EU. (Please note that the growing trend within the EU and to a lesser extent the U.S. is to use waste as a resource. Subsequently the numbers represented in these charts will have annual changes.) The EU-27 are avoiding waste to landfills through recovery, recycling, composting, and incineration, and are trying to use waste as a resource. For the EU-27, approximately 38% of waste is landfilled. The U.S. is currently approximately 33% recovered/recycled with a slow trend towards composting.

**2011 EU-27 Total MSW Generation (by material)**

Paper/Cardboard	40.0%
Food Scraps	25.0%
Plastics	19.0%
Metals	6.0%
Wood	15.0%
Glass	20.0%
Shares of packaging waste	<i>Courtesy of EEA</i>

Generally, loose residential and commercial refuse weighs 150–267 kg/m<sup>3</sup> (250–450 lb/yd<sup>3</sup>). A refuse truck will increase this density to 237–593 kg/m<sup>3</sup> (400–1000 lb/yd<sup>3</sup>). Once ejected from the refuse truck, some waste has a ‘rebound’ tendency and it will lose some density. Typically, loose on the landfill, we see loose refuse weights with an average of 207–475 kg/m<sup>3</sup> (350–800 lb/yd<sup>3</sup>). This waste needs to be compacted and in-place densities can vary from between 356–889 kg/m<sup>3</sup> (600–1500 lb/yd<sup>3</sup>) depending on the shredding and compression applied by the compacting machine. C&D landfill sites, depending on type of inbound material, sometimes see a wide range of densities from 593–1187 kg/m<sup>3</sup> (1000–2000 lb/yd<sup>3</sup>) (depending on compacting machine). Cover material will raise fill densities 119–296 kg/m<sup>3</sup> (200–500 lb/yd<sup>3</sup>) from the numbers above. When asked about the density of their landfill, most managers will give you the ‘in-place with cover’ estimates of density — Please see weights of refuse below:

**Weight of Refuse**

	kg/m <sup>3</sup>	lb/yd <sup>3</sup>
Loose Refuse:	148-237	<b>250-400</b>
Packer Truck:	237-474	<b>400-800</b>
Fill Density:	355-949	<b>600-1600</b>

**Wet Waste**

There are a number of global landfills that deal with a heavier than normal amount of ‘wet waste,’ or waste with higher than normal moisture content. In previous discussions, ‘type of waste’ will determine how the waste is handled or worked. With higher than normal moisture contents, the idea of ‘multiple’ passes (3–5) will be changed. For example, the waste will already be heavier/denser than normal (ex: 1186 kg/m<sup>3</sup> or 2000 lb/yd<sup>3</sup>) this type of waste might only require a track-type tractor or track loader to spread it. During the spread cycle, the shredding/tearing action of the track cleats provides an additional density. Or, the compactor could be equipped with a ‘wider’ flotation wheel (optional wheel from Caterpillar) that provides better flotation along with shredding and compression that will add to the density of the waste. Whichever system is used, less passes on the waste are needed to reduce the waste and add to density. (Too many passes could lead to the waste breaking down and causing traction/flotation problems on the landfill.)

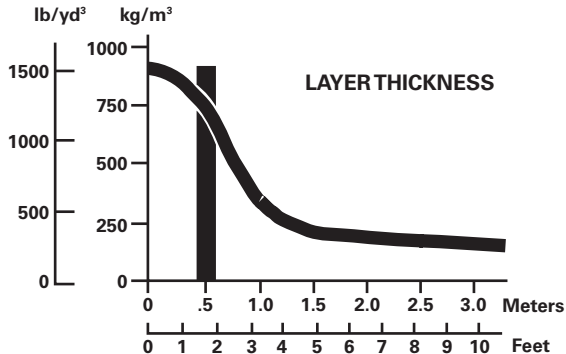

**FACTORS GOVERNING COMPACTION**

There are four factors that will determine best compaction density (layer thickness, patterns/passes, slope, and moisture content). The three areas that can be affected most by proper machine applications are:

1. Refuse Layer Thickness — The single most important factor in gaining maximum density is the depth of the layer being spread to compact. Depending on the amount of tips/wheel, type of tips, type of waste, and weight of the machine, optimum layer depth will vary. Through field testing and computer analysis, optimum layer depths for highest density have been analyzed. Below are guidelines of optimum layer depth for each compactor.
  - a. 816 — 0.3–0.4 m (12–15 in)
  - b. 826 — 0.45–0.5 m (18–20 in)
  - c. 836 — 0.5–0.6 m (20–24 in)

Layers may be placed thicker however; density will be reduced no matter how many passes the compactor performs.

Below is a Layer Thickness chart based on MSW and 4 passes by an 836.

2. Developing a Pattern and Running Proper Passes — Maximum compaction density is obtained by putting the waste down in proper layer height, running a proper pattern and going over the waste with the proper number of passes. Those operators who develop a pattern, (starting from one side of the working face and running passes over entire area that waste has been layered in a logical sequence) and run proper amount of passes, normally obtain high density. In the past, it was said “that 3–5 passes is maximum to achieve highest density. Any more passes does not justify the added fuel and maintenance for the incremental gain in density.” Again, through testing and computer modeling, it has been noted that running an extra 1–2 passes diagonally (45 degrees) over the waste after the first 4 passes, can achieve higher density through ‘shredding and knitting’ the waste together (less cover soil/ADC could also be used due to the blending of the waste). In many countries, the ‘diversion’ of compost and biodegradable materials leaves some waste streams very dry. Drier waste streams demand more passes than normal, (sometimes 5–8 passes,) so that the material can be shredded or broken down properly for best compaction density.

3. Slope — Maximum density is achieved by shredding and compression of material. Track-Type Tractors and Track Loaders achieve highest density on a 3:1 or less slope. The dynamics of track and gravity working together help shred material into smaller pieces. Although Landfill Compactors can work on steeper than 4:1 slopes, their best density is realized at 4:1 or less. The flatter the slope the better the density. The weight of the compactor is more efficiently utilized and concentrated on flatter slopes. Slight slopes sometimes add higher density due to the shearing stress that aids in shredding and blending of materials. Depending on degree of slope and whether working with another machine, (track-type tractor, dozer, or compactor) fuel use can sometimes be better uphill or downhill. Of course production is always better downhill. Again, depending on type of material and slope, tip selection for the compactor should be taken into consideration.

**COMPACTION COMPARISON ESTIMATE**

The following graph may be used as a rule of thumb for the compaction ranges of landfill machines assuming the proper operating technique is employed. (The mid ranges of each graph is assuming average waste stream and average operator.)

With correct operating procedures, tip/track/tool selection, and finally machine selection, density can be increased. An example of how increased density can increase landfill life is depicted in the next charts.

**EXAMPLE OF INCREASED COMPACTION  
ON POTENTIAL LANDFILL LIFE**

Landfill refuse capacity	1 530 000 m³ (2,000,000 yd³)	
Operating days	260	
Daily volume	365 metric tons (400 tons)	
Yearly volume	94 328 metric tons (104,000 tons)	
Compaction	Landfill Life	Gain
590 kg/m³ 1000 lb/ycd³	9.6 years	0
710 kg/m³ 1200 lb/ycd³	11.5 years	1.9 years
830 kg/m³ 1400 lb/ycd³	13.4 years	3.8 years

**COMPACTOR PRODUCTION GUIDELINES**

Model	Metric Tons/hr	U.S. Tons/hr
836K	140	135
826K	120	115
816F2	65	65

Parameters for the above: MSW, 4 passes, 18–30 m (60–100 ft) push distance, 4:1–5:1 slope, good operator.

All models are making 3 to 4 passes.

A pass is defined as: A machine traveling over the refuse one time in one direction on flat ground.

Adverse (uphill) or favorable (downhill) grades, deep layered waste, hard to handle waste, etc., will affect the above production figures.

(For tons/day — multiply by the amount of hours the machine will work in a days time.)

- A. Weather Conditions — Inclement weather affects production and density. Equipping machines with the proper track shoe or wheels and tips for the typical climate it works in will increase production and density while decreasing costs.
- B. Supplemental Tasks — There are a wide variety of tasks to be performed daily on a landfill. Understanding the ‘supplemental’ tasks that a machine might be asked to perform daily is paramount to adding the work tool(s) and right sizing the machine. For example, will the machine be required to perform site clearing, asked to build or maintain access roads, excavate cover soil, etc.? Logical choices of machines could change according to type of tasks and versatility required.
- C. Budget — Smaller landfill operations with limited budgets may have to consider single machine versatility ahead of specialized machines or multiple units.
- D. Growth — Population growth or added contracts can both increase and change inbound refuse. Future increases/decreases in refuse, type of material, density of material, etc., must be considered to properly pick tools and size machines.

## LANDFILL ESTIMATING

### Example Problem #1

A professional engineer has developed a small, rural landfill master plan. The local legislative regulatory agency has approved the plan and site.

Assume:

Waste generation: 2.04 kg/day (4.5 lb/day) per person

Waste collection: 6 days/week

Topography: flat

Land availability:

area has several suitable sites at nominal price

Population served: 30,000

Projected population in 3 years: 40,000

Current daily refuse volume: ?

Type of refuse: mostly household, some commercial

Operation: propose 8 hours/day, 5½ days/week

Present equipment: none — new site

What would your comments and recommendations be on the following:?

- Probable amount of refuse generated daily?
- Type of machine for the proposed Landfill?
- Size of machine for the proposed Landfill?

### Solution

- The current incoming waste stream can be determined to be 2.04 kg/day (4.5 lb/day) per person × 30,000 people = 61.2 metric tons (67.5 tons) daily. You must now multiply that daily generation rate by 7 for the total weekly generation, and divide by the number of days that the waste is collected (6). Therefore, your waste collection per day will be (61.2 tons/day × 7 days)/6 days of collection = 71.4 metric tons (78.7 tons) collected daily.

The same equation can be used to determine the three year projected waste stream of 40,000 residents to be 81.6 metric tons (90 tons) generated daily, 95.2 metric tons (105 tons) collected each day.

- Track loader — excavating ability, single machine application based on tonnage requirements.
- 953C handle current refuse, and has extra capacity for future growth. Small compactor if additional compaction is required.

### Example Problem #2

Existing landfill has been in operation for several years.

Assume:

Type of operation: area fill

Cover material: suitable material within 90 m (300 ft)

Current daily refuse volume: 500 metric tons (550 tons)

Anticipated daily refuse volume in 3 years:

680 metric tons (750 tons)

Type of refuse: household, commercial, large amount of brush and building demolition debris

Land availability: limited, very expensive

Available Refuse Volume: 3 249 125 m<sup>3</sup> (4,250,000 yd<sup>3</sup>)

Operation: 8 hours/days, 5½ days/week

Present equipment: D8 (3 years old)

What would your comments and recommendations be on the following:

- What range of in-place densities could be expected using a track-type tractor; a Cat steel wheeled landfill compactor?
- What effect does machine selection have on site life?
- What are the advantages and limitations of steel wheeled landfill compactors?
- What are the advantages and limitations of track-type units?
- How many machines should be used on the site?
- What type should they be?
- What size should they be?

Solution

- a. The Track-Type Tractor will achieve 475 to 595 kg/m<sup>3</sup> (800 to 1000 lb/yd<sup>3</sup>) in-place density. The Cat steel wheeled landfill compactor will achieve 595 to 830 kg/m<sup>3</sup> (1000 to 1400 lb/yd<sup>3</sup>) in-place density.
- b. There are 3 249 125 m<sup>3</sup> (4,250,000 yd<sup>3</sup>) available. 500 metric tons (550 tons) per day is how many m<sup>3</sup> (yd<sup>3</sup>)? Assume a minimum density of 475 kg/m<sup>3</sup> (800 lb/yd<sup>3</sup>).

$$500 \text{ metric tons/day} \times \frac{1000 \text{ kg/metric ton}}{475 \text{ kg/m}^3} = 1052 \text{ m}^3/\text{day}$$

$$550 \text{ tons/day} \times \frac{2000 \text{ lb/ton}}{800 \text{ lb/yd}^3} = 1375 \text{ yd}^3/\text{day}$$

$$5.5 \text{ days/week} \times 52 \text{ weeks/year} = 286 \text{ days/year}$$

$$\text{Yearly volume: } 1052 \times 286 = 300\,872 \text{ m}^3$$

$$1375 \times 286 = 393,250 \text{ yd}^3$$

Landfill life at this density:

$$\frac{3\,250\,000 \text{ m}^3}{300\,872 \text{ m}^3/\text{year}} = \frac{4,250,000 \text{ yd}^3}{393,250 \text{ yd}^3/\text{year}} = 10.8 \text{ years}$$

Similar calculations are performed to generate the following tables.

**500 METRIC TONS/DAY (550 TONS/DAY)**

Density		Landfill Life (years)
kg/m <sup>3</sup>	lb/yd <sup>3</sup>	
475	800	10.8
595	1000	13.5
715	1200	16.2
835	1400	18.9
950	1600	21.6

**680 METRIC TONS/DAY (750 TONS/DAY)**

Density		Landfill Life (years)
kg/m <sup>3</sup>	lb/yd <sup>3</sup>	
475	800	7.9
595	1000	9.9
715	1200	11.9
835	1400	13.9
950	1600	15.9

From the tables we determine that a track-type tractor, at 500 metric tons per day (550 tons/day), will provide 13.5 landfill life years at 595 kg/m<sup>3</sup> (1000 lb/yd<sup>3</sup>). Compaction will extend that life 5.4 years to 18.9 years at 835 kg/m<sup>3</sup> (1400 lb/yd<sup>3</sup>).

Proper compaction techniques are necessary to achieve the higher refuse densities and increase landfill life.

- c. Advantages: Provides highest compaction densities extending landfill life.

Limitations: Specialty unit designed to spread and compact — does not excavate virgin material economically, but can handle stockpile cover material.

- d. Advantages: most versatile unit, well suited to site preparation, finishing and access road construction and maintenance; all weather machines with excellent tractive ability.

Limitation: compaction — cannot achieve the in-place refuse densities of the specialized landfill compactors.

- e. Minimum of two. Additional equipment would depend on supplemental tasks.
- f. Track-type tractor — for earthmoving and refuse spreading work; steel wheeled compactor-quantity of refuse and land cost would justify.
- g. D8 — keeping existing unit; D9 — when new tractor is necessary; 826H — with large amount of demolition debris and brush and projected increase in tonnage would justify 826H over 816F2.

**NOTE:** Ballasting the wheels on Cat Landfill Compactors to increase machine weight and achieve higher compaction densities is not recommended. Landfills are high rimpull applications. Ballasting the wheels will significantly increase machine weight but decrease overall performance when traveling on the fill. The additional weight of ballasted wheels will also result in reduced final drive life.

## **GREEN WASTE/COMPOSTING**

Green waste and compostable material are being eliminated from most landfills. Composting is normally regulated at the state level in the U.S., and on higher governmental levels within the EU. Green and compostable waste is realized as: soil amendments, bio fuels, and incinerated energy sources. With more and more green waste and compostable material being diverted from the waste stream, tools and machines that can handle this type of waste are needed. Most commonly used are wheel loaders and excavators (wheeled/tracked) of all sizes. Most are equipped with coupler for versatility of different tools. Work tools utilized range from grapple buckets, multi-purpose buckets, and light material buckets for wheel loaders, to waste grapples, orange peel grapples, and sorting grabs for excavators. It is normal, in some areas, for regulations to request added cab filtration and protection from composting airborne debris.

## **WASTE RELATED ENERGY PRODUCTION**

There are a variety of ways to produce energy from waste. C&D landfills, green waste, biodigesters, and composting facilities, will process wood, organics and other products for: gasification, bio fuels, possible incineration, and energy from newer technologies.

## **LANDFILLS — RENEWABLE POWER WITH LANDFILL GAS**

Landfill gas, composed mostly of methane and carbon dioxide, is produced naturally as organic waste decomposes in landfills. Driven by mandate of carbon reduction goals, modern sanitary landfills capture this gas for use as a renewable fuel in specially configured Cat landfill gas generator sets. These systems deliver reliable and environmentally sound electricity to the local community from 400 kW to 2 mW power nodes.

Please contact your local dealership, Waste representative, or *Cat.com* for more information.

Cat Waste Handling Track-Type Tractor modifications are purpose built and installed at the original manufacturing facility prior to shipment.

#### Features:

- **Hinged heavy duty radiator doors** are guarded to prevent excessive trash build-up. Quick release handles allow easy access for cleaning.
- **Final drive, pivot shaft, and idler seal guarding** helps prevent wire, cable and similar material from winding around components and damaging seals.
- **Striker bars for front, rear and ripper (all optional)** keep trash from damaging fenders, fuel and hydraulic tanks or other sheet metal.
- **Lighting protection.** Front lights are mounted on top of bulldozer lift cylinders. Rear lights are ROPS mounted.
- **Waste Handling Arrangement radiator** with 6 fins/inch.
- **Elevated sprocket** removes final drives from wear environment and eliminates impact loading for extended power train life. D7E includes D10-size bearings to ensure long life.
- **Sheet metal guarding** near track and on dozer tilt hoses.
- **Fuel tank guards** keep trash from damaging fuel and hydraulic tanks or other sheet metal.
- **Final drive guards** — guard installed over the final drives to help prevent wire wrap. Guards include inspection plates, not available for D6N.
- **Reversible hydraulic demand fan** required for D6T, D7E, D8T, D9T, not available for D6N.
- **Heavy duty steps and grab handles** resist damage from landfill debris.
- **Center hole track shoes (optional)** help minimize the effects of track packing during machine operation.
- **Blade trash racks (optional)** prevent blade spill-over and damage to cylinders or radiator guard. Increase productivity in waste handling.
- **Ducted alternator available on D6T, D8T, D9T** insures adequate current is available to maintain battery and operate accessories. Not required on D7E.
- **Elevated prescreener** to remove engine air inlet from debris environment. Larger surface area to resist plugging.
- **Precleaner** removes large particulates from incoming air before they reach the air filter, helps extend filter life. (Optional on D6T through D9T.)
- **ROPS mounted air conditioning** helps prevent condenser core plugging. Provides full utilization of jacket water cooling system by avoiding additional heat load from radiator mounted condenser.
- **Laminated thermal shields** cover the CEM inside the engine compartment, hot-side of the turbocharger, and the exhaust manifold. These shields reduce surface temperatures below the flash point of most common combustibles encountered.
- **Chassis Guards.**
- **Sealed belly guards.**
- **Perforated engine enclosures** standard on D6T, D7E, D8T, and D9T. This configuration is unavailable when Sound Suppression is ordered.
- **Carrier rollers** not recommended on elevated sprocket machines.

\*\*Total bulldozer arrangement includes blade with trash rack, pusharms, braces, cylinders, lines, trunnions and lift cylinder mountings.

**Features:**

- **Unmatched versatility** — excavates, loads, carries, covers, dozes, spreads, compacts, shreds, sorts, grapples — a true all purpose machine. Performs well as a one-machine fleet, a support machine or an all-around backup unit.
- **Demolition applications** — The Waste Handling Arrangement (963D and 973D Waste Extreme Service) can also be used in demolition or demolition transfer stations when properly equipped with the extra guarding required for this severe environment.
- **Special guard** protects the final drive seals, pivot shafts and idlers from debris that can wrap around and damage these components.
- **Cat Turbine Precleaner** with prescreener to prevent airborne debris from clogging engine air intake.
- **Additional heavy duty guarding** helps protect sheet metal and machine components from damage in waste handling applications.
- **Improved serviceability** — swing open doors, guards and air coolers give quick access for cleaning debris and servicing.
- **Hinged, heavy duty radiator guard** with quick release “T” handles allows for easy access to clean the radiator.
- **Debris Barrier Package** protects machine from material entering engine and other compartments.
- **Lamp guard group** protects front and rear lamps with bolt on grids.
- **Optional rear striker bars** keep trash from climbing the track and damaging fenders.
- **Optional final drive abrasion guards** are available in two-piece or four-piece sections to protect the final drive case from premature wear from abrasion or gouging.
- **Optional trapezoidal-shaped center hole track shoes** provide maximum traction. The center holes allow sprocket to punch out dirt and debris, best choice for landfill applications.
- **Hydraulic reversing fan (953D and 963D) or variable pitch cooling fan** (optional on 973D) manually or automatically changes direction to purge accumulated debris from the radiator.
- **Cab and Operator Comfort** — Standard air suspension seat, air conditioning, adjustable steering pedals, storage area, and excellent visibility enable the operator to be more comfortable in this application for better profitability.

Weight (approx.)	1266 kg	<b>2792 lb</b>	1888 kg	<b>4163 lb</b>	2320 kg	<b>5115 lb</b>

NOTE: 973D GP and MP landfill buckets are equipped with bolt-on segments and teeth general duty.

### Features:

- **Caterpillar designed and manufactured power train** ... for optimum match, performance and efficiency. Responsive Cat diesel engine. Single-lever planetary power shift. All-wheel drive.
- **Center-point articulation** ... excellent maneuverability. Front and rear drums track, so material is chopped and compacted twice each pass.
- **Protective guarding** ... helps keep trash from damaging machine components.
- **Cat landfill blades** spread refuse and cover material ... built strong to handle the wide range of refuse encountered in landfills.
- **Operator comfort and convenience** ... sound suppressed cab with pressurized and filtered air circulation system. Adjustable suspension seat. Electronic Monitoring System and gauge package is standard.
- **Striker bars** ... standard on all Cat Landfill Compactors, prevents refuse from being carried over the rear wheels.
- **Caterpillar designed wheels** ... We test and build a Cat system. Engineers who work together with our power train, structures and manufacturing engineers design and manufacture our wheels in the same facility in which the machines are designed and built. This ensures the entire system is complemented by each component. If you alter components, you could compromise a system that was designed and tested for peak performance. If a wheel is produced that does not meet our design specifications and does not balance the load over our final drives, it could reduce the life of the bearing substantially and wear out other components creating unnecessary downtime. This also allows our standard axle guard system to work with the components for which it was designed.
- **Wheel and tip configurations** ... Three new wheel and tip configurations are available to meet your particular application:
  - 1) **Paddle tip** — High performance and less fuel burn with more traction and less weight.
  - 2) **Plus tip** — Traditional design for increased side slope stability and more mass for longer life.
  - 3) **Combination tip** — Both paddle and plus tips to give high performance with side slope stability.

**Features:**

Cat Waste Handling Wheel Loaders are equipped with the features and protection required in a demanding waste handling environment. These Caterpillar designed and built machines feature the following advantages:

- **Exceptional productivity** with fast cycle times for maximum production day-in day-out whether dozing, loading, stacking, or load and carry.
- **Protected work environment** enhances operator comfort, convenience and productivity.
- **Modified front frames** — (Standard on the 980H WHA) provide large cutouts that allows debris to fall out rather than packing and also provide easy access if cleaning is necessary.
- **Standard front drive guard and axle seal guards** (except 980H) protect from wire, string, strapping and other debris from wrapping and causing damage.
- **Front light guards** protect the lights from debris falling over the bucket spill plate.
- **Hinged crankcase and power train guards** help protect the engine and power train. The hinged design provides easy access for cleaning. (Powered guards available on some models.)
- **Standard waste application cooling system.** The improved, trash-resistant, multi-row module (IMRM) radiator, hood and engine enclosures work as a system to keep the radiator and engine compartment free of debris.
- **Trash resistant IMRM radiator** has six fins per inch (25.4 mm) and in-line tubes that resist plugging by allowing debris to pass through the core.
- **Hinged radiator prescreener** (966H and 972H) eliminates debris larger than what the radiator core will pass.
- **Hinged grill** (966H and 972H) allows access to hydraulic oil cooler and air conditioning condenser, which swing out for easy cleaning.

**Recommended Waste Handling Options**

- **Powered crankcase and power train guards** raise and lower at the flip of a switch allowing fast, easy and frequent cleanings.
- **High lift arrangement** increases bucket hinge pin height offering increased stacking and stockpiling capability. A critical feature when incoming volumes exceed conveyor capacity or floor space.
- **Traction control system (TCS)** option for 938H/IT38H provides maximum traction in slippery conditions. TCS electronically senses and limits wheel slip at each wheel independently.
- **Limited-slip differential** limits tire slip on both front and rear axles. Increases traction and reduces tire wear and scuffing in wet or dry conditions. Provides an alternative to the No SPIN differential which is not recommended due to increased tire wear, turning interference and poor tracking on dry surfaces.
- **Tire options:**
  - L-5 bias hard rock lug
  - L-5 slick
  - RL-5K Goodyear radials
  - XMINE Michelin radials (varies by model)
  - Foam-filled
- **Hitch guards** help protect components in hitch area from damage.
- **Reversing radiator fan** is hydraulically driven and can be reversed by a switch in the operator station or automatically by timer. Reduces need for cooling system cleaning and improves cooling capability.
- **Other guarding and options** are available. Contact your Cat dealer for information.

**Work Tools**

- **Refuse bucket** has excellent dozing and stockpiling capability. Large spill plate helps protect the machine from debris falling over the top of the bucket. Available in pin-on or quick coupler configurations.
- **Pallet forks** are ideal for handling refuse destined for further recycling or stacking refuse in landfills for covering.

- **Multi-purpose bucket** has the capability to clamp and sort large objects, doze cover material or other light dozing chores.
- **Quick coupler** increases versatility by allowing a single machine to utilize a wide variety of work tools in a host of applications.

**WORK TOOLS**

As described in the opening statements of this section, the waste stream can consist of many different types of materials sometimes all blended together. For that reason, work tools become a very important part of moving,

sorting, and dozing in waste applications. (Continue to consider the thought process of; “what is the application and material(s) you will work with — then, what tool(s) will accomplish your objectives, and finally, what machine(s) will utilize that tool to perform in that application?”)

**Wheel Loader Work Tools**

There are a variety of work tools for small-medium wheel loaders that have couplers. It is important to check the tasks that the wheel loader will perform and equip as needed. The 924-980 wheel loaders have three waste specific designed 'pin on' buckets to choose from.

- **Load & Carry Bucket** — An overall use bucket that is open and deep throated to gather and retain large loads. This bucket provides the ability to push, stockpile, load, and tamp no matter what type of loading is required.
- **Doze Bucket** — The height of this bucket provides more of a push platform to move heavy loads on the floor into waiting haul vehicles. Its main strengths are for pushing, stockpiling, and loading below grade vehicles.
- **Tamp and Clamp Bucket** — Designed with a longer snout and "optional" top clamps, this bucket is best for sorting, loading, and tamping haul vehicles with hard to handle materials. It has slightly less capacity than the load & carry and push buckets.

There are a variety of waste work tools for excavators and wheeled excavators. For Tracked and Wheeled Excavators you need to ask its primary use. Loading and Tamping, Sorting, Combination, Other Support?

- **Trash Grapple** — Designed to load and tamp large loads of material into haul vehicles. They can perform some material separation, but its main strength would be to load and tamp.

- **Sorting Grapple** — This grapple is designed to sort, separate, and load material. Equipped with a rotator, its main strength lies in the ability to separate material quickly, swing/rotate, and load haul vehicles, conveyors, and hoppers efficiently.
- **Orange Peel Grapple** — Also designed to sort, separate, and load material, its main strength is in a slightly larger load capability than the sorting grab. It also has the capability to rotate.
- **Contractor's Grapple** — Designed like the Waste Grapple, it is slightly smaller with a two over three tine configuration instead of four over five. It is heavier in construction and designed for materials heavier than MSW.

There is a wide variety of work tools for Excavators (wheeled and tracked) that can be used in waste applications; the above are "waste handling" tools designed for the application.

### Support Work Tools

Brooms, pallet forks, bale clamps, blades, lifting arms, are just a few of the 'coupler attached' work tools that are used within the waste industry. A thorough assessment of primary and support roles of machine needs to be performed.

As stated in the chart, please contact your Dealer/Waste Representative or *Cat.com* websites for more information.

## WHEEL DOZERS

### Features:

- **Reliable Cat® power train:** four-stroke-cycle diesel with adjustment-free fuel system ... full power shift with single lever on-the-go shifting.
- **Articulated frame steering** with hinge point midway between front and rear axles ... short turning radius, long wheelbase ... rear and front wheels track at all times.
- **Machine balance** ... equal weight distribution on axles when blading.
- **All dozer functions**, including tip and tilt, hydraulically controlled from operator's seat.
- **STIC™ (Steering Transmission Integrated Control)** Steering is now offered on all Wheel Dozers, except the 814.

 4 - 4th Gear

**CONSIDERATIONS IN MACHINE SELECTION**

The following factors should be considered when comparing wheels vs. tracks:

**Traction**

You can figure coefficient of traction, depending on underfoot conditions, from the Table Section in this book.

Wheels — up to 0.65 (in quarry pit with good floor)

Track — up to 0.90 (in soils permitting grouser penetration)

Usable Rimpull = Machine Weight × Coefficient of Traction

**Speed**

Wheels — travel speeds up to three times higher than track.

**Maneuverability**

Articulated steering and good visibility give wheel tractors high maneuverability.

**Cost**

See Owning and Operating Costs section. Tire vs. undercarriage costs can often be the deciding factor in selecting wheels or tracks.

**Compaction**

Ground Pressure:

Wheels — from 241 kPa (35 psi) to 310 kPa (45 psi)

Tracks — from 82 kPa (12 psi) to 97 kPa (14 psi)

**Application**

*Utility* ... mobility, maneuverability and good speed suit wheel tractors for yard and stockpile work and for clean-up around shovels. Lower maintenance costs may be realized in certain soils that can be highly abrasive to track-type undercarriages.

*Coal pile* ... recommend wheel tractors in this application when following conditions are present:

- Long push distances
- Need for good material spread
- High degree of compaction desired

*Production Dozing* ... a wheel tractor should be considered in the following conditions:

- Long push distances
- Loose soils, little or no rock
- Level or downhill work
- Good underfoot conditions

*Pushloading Scrapers* ... a wheel tractor should be considered in the following conditions:

- Thin scraper cut
- Good underfoot conditions — no rock
- Higher push speeds

*Chip and Coal Scoops* ... a wheel dozer scoop should be considered in the following conditions:

- Long push distances
- Light, well processed materials such as coal or wood chips
- High degree of compaction desired
- Low to modest grades

**COUNTERWEIGHTS AND BALLAST**

For each specific application, there is a correct machine weight for proper balancing of traction, flotation, mobility and response.

- Low machine weight may increase tire slipping and wear, but improves flotation, mobility and machine response.
- High machine weight increases traction, but decreases mobility and response.

The machine weight is optimum for the operating conditions when wheel slipping barely occurs in the gear being used. Weight distribution under operating conditions should then be approximately equal between the wheels to balance power to each axle.

**Application**

Lower machine weight is usually required for applications such as fill spreading, stockpiling, road maintenance, towing compactors, and shovel cleanup. These are generally performed in either first or second gear. However, usage of second gear may involve a tradeoff of increased GET wear on the blade.

Higher machine weight is usually required for applications such as heavy dozing and push-loading, which are generally performed in first gear.

## TIRE SELECTION & MAINTENANCE

Requirements of traction, flotation and tire life are met by a choice of tire size, tread design and inflation pressure.

### Tire Width

For good conditions with little rolling resistance on surfaces where flotation is no problem, a narrower tire may be most economical. It may also be considered in muddy conditions in which the mud can be penetrated to reach firm earth underneath.

Where flotation problems and increased rolling resistance are encountered, wider tires are recommended. The greater contact area and shallower penetration increases flotation.

### Tire Size

Larger optional tires will also improve flotation in soft conditions. With larger diameter, rimpull will be reduced which may be desirable to help control wheel spin.

**Rock — Deep Tread (L-4)** provides 50% more tread depth, thicker undertread and sidewall with increased tire life when compared to the L-3 tire. Recommended in rock conditions where sharp fragments cause high tire wear or sudden failures.

**Rock — Extra Deep Tread (L-5)** provides 150% more tread depth when compared to the L-3 tire. Intended for severe rock conditions with extreme penetration hazards.

### Inflation Pressure

In average operating conditions the recommended inflation pressure prevents excessive deflection and minimizes tire rollover on side slopes.

### Over-inflation

Reduces amount of tread contact with ground and provides less flotation. Over-inflation causes center of tread to wear faster and increases the chance of cuts and impact breaks.

### Under-inflation

Can cause permanent tire damage in the form of flex breaks, radial cracks, and tread or ply separation. On jobs where wrinkling and bead rollover *are not* apparent, inflation pressure may be reduced to a minimum of:

<i>Bias Ply</i>	—	170 kPa (25 psi) on 35/65-33
		170 kPa (25 psi) on 29.5-25
		170 kPa (25 psi) on 26.5-25
		170 kPa (25 psi) on 23.5-25
<i>Radial</i>	—	310 kPa (45 psi) on 35/65-R33
		310 kPa (45 psi) on 29.5-R25
		205 kPa (30 psi) on 26.5-R25
		240 kPa (35 psi) on 23.5-R25

Reduced pressure will:

- Increase flotation and traction in sand.
- Improve envelopment characteristics to reduce sudden death failure on rock jobs.
- Provide better tread wear by reducing contact pressure between tire and ground.

Consult your tire manufacturer before changing tire pressures.

## Features:

- **Dozing, filling and compacting versatility.**
- **High speed operation** with responsive Cat diesel engine, single-lever planetary power shift transmission, and all-wheel drive.
- **Articulated frame** makes maneuvering quick and easy. Long wheel base for stability.
- **Wheels with tamping foot design and chevron pattern** give traction, penetration and compaction needed for high production. Foot pattern reversed on trailing drums to prevent overprinting lead drums.
- **Rear drums track front** for double compactive effort. Drum spacing covers mid-axle strip on return pass.
- **Rear axle oscillation** keeps all drums on ground for traction and stability.
- **Cleaner bars** keep drums free of carry over earth regardless of rolling direction. Adjustable, replaceable.
- **Optional fill spreading dozer** has single lever control for raise, lower, hold and float. (Blade tilt optional.)
- The 825K now offers **STIC (Steering Transmission Integrated Control) Steering** as a standard feature.

**COMPACTION FUNDAMENTALS**

The following discussion applies to soil compaction only.

**Definition**

Compaction is the process of physically densifying or packing the soil ... resulting in increased weight per unit volume. It is generally accepted that the strength of a soil can be increased by densification. Three important factors affect compaction.

- Material gradation
- Moisture content
- Compactive effort

*Material Gradation* — refers to the distribution (% by weight) of the different particle sizes within a given soil sample. A sample is *well-graded* if it contains a good, even distribution of particle sizes. A sample composed of predominantly one size particle, is said to be *poorly-graded*. In terms of compaction, a well-graded soil will compact more easily than one that is poorly-graded. In well-graded material the smaller particles tend to fill the empty spaces between the larger particles, leaving fewer voids after compaction.

**MATERIAL GRADATION**

Poorly-graded

Well-graded

*Moisture Content* — or the amount of water present in a soil, is very important to compaction. Water lubricates soil particles thus helping them slide into the most dense position. Water also creates clay particle bonding, giving cohesive materials their sticky qualities.

**OPTIMUM MOISTURE**

Heavy clay	17.5%
Silty clay	15.0%
Sandy clay	13.0%
Sand	10.0%
Gravel, sand, clay mix (pit run)	7.0%

Experience has shown that it is very difficult, if not impossible, to achieve proper compaction in materials that are too dry or too wet. Soil experts have determined that in practically every soil there is an amount of water, called optimum moisture content, at which it is possible to obtain maximum density with a given amount of compactive effort. The curve below shows this relationship between dry density and moisture content. It is called a compaction curve, moisture-density curve or Proctor curve.

*Compactive Effort* — refers to the method employed by a compactor to impart energy into the soil to achieve compaction. Compactors are designed to use one or a combination of the following types of compactive effort.

- Static weight (or pressure)
- Kneading action (or manipulation)
- Impact (or sharp blow)
- Vibration (or shaking)

## COMPACTOR TYPES

Compaction equipment can be grouped generally into the following classifications:

- sheepsfoot
- vibratory
- pneumatic
- high speed tamping foot
- chopper wheels (see Landfill Compactor section)

Combinations of these types are also available, such as a vibrating smooth steel drum.

For ease of comparison, the compactors have been placed on the Zones of Application Chart shown below. This chart contains a range of material moistures from 100% clay to 100% sand, plus a rock zone. Each type has been positioned in what is considered to be its most effective and economical zone of application. However, it is not uncommon to find them working out of their zones. Exact positioning of the zones can vary with differing material conditions.

### RANGES OF SOIL TYPES FOR SOIL COMPACTION EQUIPMENT

**COMPACTOR PRODUCTION**

Compactor production is expressed in compacted cubic meters (Cm<sup>3</sup>) or compacted cubic yards (CCY) per hour. Material in its natural or bank state is measured in bank cubic meters or yards (Bm<sup>3</sup> or BCY). When it is removed or placed in a fill, it is measured in loose cubic meters or yards (Lm<sup>3</sup> or LCY).

When the loose material is worked into a compacted state, the relationship of *compacted material to bank material* is shown as the shrinkage factor (SF).

$$SF = \frac{\text{Compacted cubic meters (Cm}^3\text{)}}{\text{Bank cubic meters (Bm}^3\text{)}}$$

$$SF = \frac{\text{Compacted cubic yards (CCY)}}{\text{Bank cubic yards (BCY)}}$$

The construction industry has developed the following formula for use in estimating compactor production. This formula gives the material volume a given machine can compact in a 60-minute hour.

**Metric Method**

$$\text{Cm}^3 = \frac{W \times S \times L}{P}$$

W = Compacted width per pass, in meters. (For Cat Compactors it is recommended that W = Twice the width of one wheel.)

S = Average speed, in kilometers per hour.

L = Compacted thickness of lift, in millimeters.

P = Number of machine passes to achieve compaction (**can only be determined by testing the compacted material density on-the-job**).

**English Method**

$$\text{CCY/hr} = \frac{W \times S \times L \times 16.3}{P}$$

W = Compacted width per pass, in feet. (For Cat Compactors it is recommended that W = Twice the width of one wheel.)

S = Average speed, in miles per hour.

L = Compacted thickness of lift, in inches.

16.3 = Conversion constant, equals 5280 feet ÷ 12 inches ÷ 27 cubic feet

P = Number of machine passes to achieve compaction (**can only be determined by testing the compacted material density on-the-job**).

Example problem (Metric)

Determine production for an 815F2 operating under the following conditions:

$$P = 5, S = 10 \text{ km/h}, L = 100 \text{ mm}$$

Refer to 815F2 in the production table on the next page. Read down the first column until reaching section for 5 passes. Within this section in the second column, find the speed closest to 10 km/h. Read across this line to the 100 mm compacted lift. Read the production figure given.

**Answer:** 377 Cm<sup>3</sup>/h. (Since the machine's speed of 10 km/h is slightly faster than the 9.5 of the table, production may be interpolated slightly higher — say 395 Cm<sup>3</sup>/h.)

Example problem (English)

Determine production for an 825K operating under the following conditions:

$$P = 4, S = 8 \text{ mph}, L = 6 \text{ inches}$$

Refer to the production estimating table on the next page. This table contains estimates for the 815F2 and 825K Compactors using various speeds, lift thicknesses and number of passes. These figures were calculated using the formula discussed on this page. The figures represent 100% efficiency. W = Twice the width of one wheel.

In the 825K portion of this table, read down the first column until reaching the section for four passes. Within this section in the second column, find the line for 8 mph. Read across this line to the lift thickness column for 6 inches. Read the production figure given.

**Answer:** 1444 CCY/hr.

**PRODUCTION TABLE**

### WHEEL LOADERS

#### Features:

- Cat® heavy duty diesel engine.
- Productive operator environment. Excellent visibility.
- Automatic lift and bucket controls.
- Adjustable suspension seat and steering column.
- Four wheel enclosed wet disc brakes.
- Automatic power shift transmissions. Allows operator to select automatic or manual mode.
- Hydrostatic drive on 903C2, 906K/M, 907K/M, 908K/M, 910K/M, 914K/M, 918M, 924K, 926M, 930K/M and 938K/M.
- Transmission neutralizer switch (950H-980H, 950K-980K, 950L-980L and 950M-982M).
- Advanced power train with continuously variable transmission available on the 966M XE and 972M XE.
- Computerized machine function monitoring.
- Command control steering with integrated transmission controls and electro-hydraulic controls ... 950H-980H.
- Electro-Hydraulic (EH) Joystick Steering with Force Feedback (Speed Sensitive) on 966K, 966M, 972K, 972M, 980K, 980M and 982M (optional on 950M and 962M).
- Lock up clutch on 950L, 950M, 962L, 962M, 966L, 966M, 972L, 972M, 980L, 980M, 982M, 988K, 990K and 994K (optional on the 980K, 992K and 993K).
- Impeller clutch on 988K, 990K, 992K, 993K and 994K.
- Tilting hood ... 950H-980H, 950K-980K, 950L-980L and 950M-982M.
- Brake wear indicator.
- Limited slip differentials on 924K, 926M, 930K/M, 938K/M (optional on 950H-980H, 950K-980K, 980L, 980M and 982M).
- Differential locks ... 903C2, 906K/M, 907K/M, 908K/M, 910K/M, 914K/M, 918M, 924K, 926M, 930K/M, 938K/M, 950M, 962M, 966M and 972M (optional on 950L, 962L, 966L and 972L).
- Automatic Ride Control suspension system. Operator select “on,” “off” or “automatic” (excluding 903C2).
- Payload control system (excluding models below 924K).
- Optional Fusion coupler system for attachment interchangeability with pin-on performance. Attachments can interchange across the entire SWL/MWL/IT line (excluding models below 924K).
- Performance Series Buckets — Reduced dig times and better material retention lead to significant productivity and fuel efficiency improvements (910K/M, 914K/M, 918M, 924K, 926M, 930K/M, 938K/M, 950H-980H, 950K- 980K, 950L-980L and 950M-982M).

Listed features may be standard on some models, optional or unavailable on others. Contact your Cat dealer for specific information.

<b>MODEL</b>	<b>903C2</b>		
Flywheel Power: Net	30 kW		40 hp
Gross	31 kW		42 hp
Engine Model		<b>C2.4*</b>	
Rated Engine RPM		<b>2200</b>	
Bore	87 mm		3.4"
Stroke	102 mm		4.0"
No. Cylinders		<b>4</b>	
Displacement	2.4 L		147 in <sup>3</sup>
Forward Speed	16 km/h		10 mph
Reverse Speed	16 km/h		10 mph
Hydraulic Cycle Time, Rated Load in Bucket:		<b>Seconds</b>	
Raise		<b>4.8</b>	
Dump		<b>0.8</b>	
Lower		<b>3.2</b>	
Total		<b>8.8</b>	
Tread Width	1314 mm		4'4"
Width Over Tires	1708 mm		5'7"
Ground Clearance	395 mm		1'4"
Fuel Tank Capacity	43 L		11.4 U.S. gal
Hydraulic System Capacity (includes tank)	24 L		6.3 U.S. gal

\*These machines meet U.S. EPA Tier 4 Final emission standards and are only available in certain regions. Contact your local Cat dealer for product availability.

\*Meets Tier 4 Interim, Stage IIIB, and Japan 2011 (Tier 4 Interim) equivalent emission standards.

\*\*Meets Tier 4 Final/Stage IV OR Tier 3/Stage IIIA equivalent OR Tier 2/Stage II equivalent emission standards.

\*\*\*Changes in bucket weight, including field installed wear iron, can impact rated payload. Consult your Cat dealer for assistance in selecting and configuring the proper bucket for the application. The Cat Large Wheel Loader Payload Policy is a guideline intended to maximize wheel loader structural and component life. The Cat Payload Policy is that the "Gross Bucket plus Payload Capacity" is the MAXIMUM weight that should be carried on the end of the Lift Arm/Boom.

\*\*\*\*Raise is from carry position for the 972K and 980K.

**NOTE:** For 972K and 980K, Net Engine Power is provided according to SAE J1349 and ISO 9249. Gross Engine Power is provided according to SAE J1995.

\*\*\*Meets Tier 2/Stage II/Japan 2001 (Tier 2) equivalent OR Tier 4 Final/Stage IV/Japan 2014 (Tier 4 Final) emission standards.

†Changes in bucket weight, including field installed wear iron, can impact rated payload. Consult your Cat dealer for assistance in selecting and configuring the proper bucket for the application. The Cat Large Wheel Loader Payload Policy is a guideline intended to maximize wheel loader structural and component life. The Cat Payload Policy is that the "Gross Bucket plus Payload Capacity" is the MAXIMUM weight that should be carried on the end of the Lift Arm/Boom.

††Raise is from carry position for the 972H and 980H.

NOTE: 972H and 980H Net Engine Power is provided according to SAE J1349 and ISO 9249. Gross Engine Power is provided according to SAE J1995. The 972H and 980H are not available in all regions. Contact your local Cat dealer for product availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 23.5R25 XHA2 L3 radial tires, full fluids, operator, cold start, roading fenders, Product Link, Manual Diff Lock/Open axles (front/rear), power train guard, secondary steering and sound suppression. (With Tire Deflection) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing. (No Tire Deflection) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Machine and bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 23.5R25 XHA2 L3 radial tires, full fluids, operator, cold start, roading fenders, Product Link, Manual Diff Lock/Open axles (front/rear), power train guard, secondary steering and sound suppression. (With Tire Deflection) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing. (No Tire Deflection) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Machine and bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 23.5R25 XHA2 L3 radial tires, full fluids, operator, cold start, roading fenders, Product Link, Manual Diff Lock/Open axles (front/rear), power train guard, secondary steering and sound suppression. (With Tire Deflection) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing. (No Tire Deflection) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Machine and bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 29.5R25 XLDD1 L4 radial tires, full fluids, operator, standard counterweight, cold start, roading fenders, Product Link, limited slip differentials, power train guard, secondary steering and sound suppression.

\*\*Rock bucket specifications are given on Michelin 29.5R25 XLDD2 L5 Radial tires.

(§) Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Machine and bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 29.5R25 XLDD1 L4 radial tires, full fluids, operator, aggregate counterweight, cold start, roading fenders, Product Link, limited slip differentials, power train guard, secondary steering and sound suppression. If a rock bucket is added, those values are with Michelin 26.5R25 XLDD2 L5 tires.

\*\*Aggregate Handler configuration is not compatible with teeth and segments, tips, rock buckets, high lift, L5 tires.

(§) Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Machine and bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Bridgestone 875/65R29 VLTS L4 radial tires, full fluids, operator, aggregate counterweight, cold start, roading fenders, Product Link, limited slip differentials, power train guard, secondary steering and sound suppression.

\*\*Aggregate Handler configuration is not compatible with teeth and segments, tips, rock buckets, high lift, L5 tires.

(§) Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Machine and bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a global machine configuration with Michelin 23.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, standard linkage, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a global machine configuration with Michelin 23.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, standard linkage, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a global machine configuration with Michelin 23.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, standard linkage, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a global machine configuration with Michelin 23.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, standard linkage, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 26.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 26.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

\*\*\*Rock bucket specifications are given on Michelin 26.5R25 XLDD2 L5 Radial tires.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a machine configuration with Michelin 29.5R25 XLDD1 L4 Radial tires, full fluids, operator, standard counterweight, standard transmission, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

\*\*\*Rock bucket specifications are given on Michelin 29.5R25 XLDD2 L5 Radial tires.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(Rigid Tire) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on a global machine configuration with Michelin 23.5R25 XHA2 L3 Radial tires, full fluids, operator, standard counterweight, standard linkage, cold start, roading fenders, Product Link, open differential axles (front/rear), power train guard, secondary steering, and sound suppression.

\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732C.

(§) Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732C governing loader ratings.

(ISO) Full compliance to ISO 14397-1 (2007) Sections 1 thru 6, which requires 2% verification between calculations and testing.

(No Tire Deflection) Compliance to ISO 14397-1 (2007) Sections 1 thru 5.

\*Static tipping loads and operating weights shown are based on standard machine configuration with 26.5R25 L3 Michelin XHA2 radial tires, power train guard, full fuel tank, coolants, lubricants, air conditioner and operator.

Static tipping loads conform to the international standard as defined in ISO 14397-1 (SEPT2007).

\*\*Measured 100 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 (APR2007).

**NOTE:** Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732 (APR2007) which governs loader ratings.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Static tipping loads and operating weights shown are based on standard machine configuration with 29.5R25, L3 Michelin XHA2 radial tires, power train guard, full fuel tank, coolant, lubricants, air conditioner and operator.

Static tipping loads conform to the international standard as defined in ISO 14397-1 (SEPT2007).

\*\*Measured 100 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 (APR2007).

**NOTE:** Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers, including SAE Standard J732 (APR2007) which governs loader ratings.

**NOTE:** Bucket availability varies by region. Consult your local dealer for availability.

\*Tipping loads were calculated within guidelines of ISO 14397-1:2007 to include tire squash (Tire pressure at 683 kPa [99 psi]).

\*\*Tipping load is calculated without tire squash.

\*\*\*Static tipping load and operating weight shown are based on standard machine configurations with a fuel tank, coolant, lubricants, and operator.

**NOTE:** Specifications and ratings conform to all applicable standards recommended by the Society for Automotive Engineers. SAE Standards J732C govern loader ratings and are denoted in the text by (\$).

\*Dimensions are measured to the tip of the bucket teeth to provide accurate clearance data. SAE Standards specifies the cutting edge.

\*\*Static tipping load and operating weight shown are based on standard machine configuration with 50/65-51 tires, full fuel tank, coolant and lubricants.

\*\*\*Measured 102 mm (4") behind tip of cutting edge with bucket hinge pin as pivot point in accordance with SAE J732 JUN92.

#Tipping load is calculated without tire squash.

NOTE: Specifications and ratings conform to all applicable standards recommended by the Society of Automotive Engineers (SAE). SAE Standards J732 JUN92 and J742 FEB85 govern loader ratings denoted in text by (\$).

# Wheel Loaders Integrated Toolcarriers

## Machine Dimensions ● 903C2

Dimensions listed are based on the machine configured with cab with air conditioning, quick coupler, general purpose bucket or 1067 mm (42 in) forks, 75 kg (165 lb) operator and 33 x 15.5-16.5, 12PR tires.

All dimensions are approximate.

MODEL	903C2 Standard		903C2 High Lift	
A Cab height	2510 mm	8'3"	2510 mm	8'3"
B Ground clearance	395 mm	1'4"	395 mm	1'4"
C Wheelbase	1800 mm	5'11"	1800 mm	5'11"
* D Overall length with bucket	4695 mm	15'5"	4860 mm	15'11"
* E Reach at maximum dump height	875 mm	2'10"	880 mm	2'11"
F Dig depth	200 mm	8"	200 mm	8"
* G Maximum dump height	2290 mm	8'0"	2430 mm	8'0"
H Load over height	2795 mm	9'2"	2940 mm	9'8"
J Hinge pin at maximum height	3080 mm	10'1"	3225 mm	10'7"
K Departure angle (degrees)		30°		30°
L Overall length with forks	5175 mm	17'0"	5330 mm	17'6"
M Reach at level ground	970 mm	3'2"	1130 mm	3'8"
N Maximum reach	1515 mm	5'0"	1635 mm	5'4"
O Fork depth above ground	40 mm	2"	40 mm	2"
P Fork height at maximum reach	1415 mm	4'8"	1415 mm	4'8"
Q Maximum fork height	3000 mm	10'2"	3140 mm	10'4"
R Fork reach at maximum height	750 mm	2'6"	755 mm	2'6"
* S Turning radius over bucket	3940 mm	13'1"	4020 mm	13'2"
** T Turning radius inside tire	1655 mm	5'5"	1655 mm	5'5"
* U Width over bucket	1770 mm	5'10"	1770 mm	5'10"
V Tire gauge	1314 mm	4'4"	1314 mm	4'4"
** W Machine width	1708 mm	5'7"	1708 mm	5'7"
X Articulation angle		40°		40°
Y Steering angle – left/right		80°		80°
Z Dump angle at maximum height		40°		40°

\*Vary with bucket size.

\*\*Vary with tire size.

Machine Dimensions  
 ● 906K/M, 907K/M, 908K/M  
 ● Horizontal Pin Coupler

Wheel Loaders  
 Integrated Toolcarriers

Dimensions shown are based on the machine equipped with general purpose bucket and standard 405/70 SPT9 tires.

All dimensions are approximate.
